More Precision

# confocalDT // Confocal chromatic sensor system

# Confocal chromatic displacement and thickness measurements **confocalDT**

## Highest precision in confocal chromatic displacement and thickness measurements

The confocalDT sensors product range stands for the highest precision and dynamics in confocal chromatic measurement technology. A large number of sensors and different interfaces can be used in versatile measurement tasks, e.g., in the semiconductor industry, glass industry, medical engineering and machine building.

Curved lenses

# Overview confocalDT

Compact systems		Measuring range	Measurement mode	Page
confocalDT IFD2410	Next generation confocal sensor system	1.0 mm 6.0 mm	Distance measurement Thickness measurements	10 - 11
confocalDT IFD2415	Best in class - Next-generation confocal sensor system	1.0 mm 10.0 mm	Distance measurement Thickness measurements Multi-peak measurement	12 - 13
confocalDT IFD2411	Compact confocal measuring system	1.0 mm 6.0 mm	Distance measurement Thickness measurements	14 - 15

Sensors		Measuring range	Measurement direction	Measurement mode	Page
confocalDT IFS2402	Confocal chromatic miniature sensors ø4 mm	0.5 mm 3.5 mm		Distance measurement	16 - 17
confocalDT IFS2403	Confocal chromatic hybrid sensors ø8 mm	0.4 mm 10 mm		Distance measurement Thickness measurements	18 - 19
confocalDT IFS2404	Confocal chromatic sensors ø12 mm	2 mm		Distance measurement Thickness measurements	20
confocalDT IFS2405	Precise confocal sensors ø27 - 62 mm	0.3 mm 30 mm		Distance measurement Thickness measurements	21 - 23
confocalDT IFS2406	Confocal chromatic sensors for displacement and thickness measurements ø20 - 27 mm	2.5 mm 10 mm		Distance measurement Thickness measurements	24 - 25
confocalDT IFS2407	High precision sensors for displacement and thickness measurements ø12 - 54 mm	0.1 mm 3 mm		Distance measurement Thickness measurements	26 - 27

Each sensor can be operated with every confocalDT controller.

Controller		Channels	Measuring rate	Page
confocalDT IFC242x	Confocal controller for industrial applications	1 or 2	up to 10 kHz	28 - 29
confocalDT IFC246x	Light-intensive controller for high speed measurements	1 or 2	up to 30 kHz	30 - 31

Accessories	Page
System design	32 - 33
Sensor solutions and vacuum feedthroughs	34
Mounting adapter	35
Adjustment adapter	36 - 39
Cables	40 - 41
Interface modules	42 - 43

# Measuring principle and fields of application **confocalDT**

### The confocal chromatic measuring principle

Polychromatic white light is focused onto the target surface by a multilens optical system. The special lens arrangeent splits the white light into monochromatic wavelengths by controlled chromatic aberration. To each wavelength, a specific distance is assigned by factory calibration. Only the wavelength which is exactly focused on the target is used for the measurement. An optical arrangement images the light reflected onto a light sensitive sensor element. This sensor element detects the corresponding spectral color and evaluates it. In the case of multi-peak measurements, several distance points are evaluated accordingly.

## High measuring rate for dynamic measurement tasks

The confocalDT systems offer high measuring rates for measurement tasks with high dynamics. The controller dynamically regulates the exposure of the CCD line. This exposure control compensates for color and reflectivity changes of the measuring object in order to increase the measurement accuracy at high measuring rates.

Set up and configuration of controller and sensors is handled in a user-friendly web interface via Ethernet connection. No additional software is required. For thickness measurements, materials are stored in an editable materials database.

#### Compact sensors for restricted installation spaces

The compact design with diameters from 4 mm enables integration in restricted spaces. With the 90° models, the required installation depth is again significantly reduced.

## Robust optical fibers for robots and drag chains

Offering high flexibility and lengths up to 50 m, the robust optical fibers are ideal for measurement tasks on the robot and in automation technology.

## The world's smallest light spot for high lateral resolution

The confocalDT sensors are available with different aperture angles. A large aperture angle with a high numerical aperture (NA number) enables a small light spot (X-Y resolution) as well as a high Z-axis resolution, allowing the smallest details to be detected with high precision. The size of the light spot remains almost constant over the entire measuring range.

Large measuring angle – ideal for curved and structured surfaces The confocalDT IFS sensors tolerate a large measuring angle up to 48°. Therefore, curved and structured surfaces can be detected reliably to generate stable signals.

#### Vacuum applications

The confocalDT sensors consist of passive components and do not emit heat. For the use in vacuum, special sensors, cables and other accessories are available.

# Absolute distance measurement **confocalDT**

## High-precision displacement and distance measurements on almost all types of surface

The confocal sensor systems from Micro-Epsilon are used for highresolution displacement and distance measurements. Due to the innovative technology, measurements can be performed on both diffuse and specular surfaces with high stability. The high measuring rate also allows for high speed processes to be monitored reliably.

### Distance measurement on transparent objects

High-precision distance measurement is required for contour measurement or positioning of glass lenses. The confocalDT sensors detect curved surfaces with a resolution of up to 18 nm. Thanks to their high measuring rate, the transparent targets can be measured at high speed.

#### High precision distance control

In 3D printing of complex components as well as in PCB printing, precise positioning with submicrometer accuracy is essential. Here, confocal sensors are used. These detect the distance with the highest precision and at the same time a high measuring rate in order to be able to monitor even dynamic processes.

#### Mounting adapter for fine adjustment

To achieve orthogonal alignment of the sensor for high-precision distance measurements, a mounting adapter is available for fine adjustment.

# Precise thickness measurement **confocalDT**

Thickness measurement signal

# Signal with multi-layer thickness measurements (max. 6 peaks)

#### Thickness measurement of transparent materials in the micron range

The confocalDT sensors enable thickness measurements of transparent materials. A sensor detects the material thickness with micrometer precision. Thanks to the integrated multi-layer measurement, the thickness of multi-layer objects such as laminated glass can be evaluated.

The confocalDT sensors are ideally suitable for one-sided thickness measurement of transparent objects such as bottles. Therefore, thicknesses between 5  $\mu$ m and 30 mm can be measured. Even curved contours such as the bottle neck or bottoms are precisely detected. The color of the bottle does not matter for this measurement. This allows 100% end-of-line quality control to be performed inline.

# Thickness calibration for precise thickness measurements regardless of distance

Changing material thickness and a varying distance between the target and the sensor produce faulty measurement values. Therefore, confocalDT controllers from Micro-Epsilon offer a thickness calibration feature. By selecting the respective target material, the distance-dependent error is automatically compensated for which enables to achieve the highest possible measurement accuracy.

Mounting adapter for two-sided thickness measurements

The JMA-Thickness mounting adapter is used for the congruent alignment of two sensors.

# Applications confocalDT

Thickness measurement of displays and flat glass Glass sheets for the production of displays require a homogeneous thickness profile. Confocal chromatic sensors from Micro-Epsilon determine the thickness without making contact from one side.

Recommended sensors: IFS2405

#### Restricted installation space

Miniature sensors with a diameter of 4 mm are suitable for measurements in confined installation spaces, e.g., for the inspection of boreholes. Furthermore, the 90° version of these sensors enables to measure the finest interior contours. *Recommended sensors: IFS2402* 

#### Coordinate measuring machines

The compact confocalDT 2410 / 2415 models have an integrated controller. Since no optical fiber is required, the space-saving sensor is particularly suitable for dynamic applications such as in measuring machines.

Recommended sensors: IFD2410 / IFS2415

## Wall thickness measurement of container glass

Wall thickness distribution is a crucial quality criterion for container glass. In order to determine the glass thickness of the bottom and the walls, confocal chromatic sensors from Micro-Epsilon are used. Measurements are performed without contact and at a high measuring rate.

Recommended sensors: IFS2406

# Displacement and distance measurements in 3D printing machines

The compact controllers of the confocalDT 2411 series are used for distance control in industrial printers. The sensor system impresses with a measuring rate of up to 8 kHz and a resolution of up to 12 nm. Due to their compact design, the controllers can be optimally integrated in the control cabinet.

Recommended sensors: IFD2411

Measuring on hot glass Confocal sensors can also be used for the measurement of hot glass. The large offset distance allows for the sensor to be mounted from a safe distance to the hot glass. *Recommended sensors: IFS2405-28* 

Confocal chromatic sensors monitor the gap between the mask and the glass. Thanks to the 90° design, the sensors can be integrated in an extremely space-saving manner.

Thickness measurement on the star wheel Fast dual-channel thickness measurement of glass bottles in the industrial production process.

Recommended sensors: IFS2406-10

Recommended sensors: IFS2406/90-2,5

# Confocal chromatic sensor system with integrated controller confocalDT IFD2410

# All-in-One: compact confocal sensor with optimal price/performance ratio

The confocalDT IFD2410 is an innovative confocal sensor with integrated controller. The space-saving IP65-housing enables fast integration into plant equipment and machines as no optical fiber is required. This makes the IFD2410 ideally suited to high precision distance and thickness measurements in industrial series applications.

The active exposure regulation of the CCD line enables fast and accurate compensation of varying surfaces even in dynamic measurement processes up to 8 kHz. Based on its excellent price/ performance ratio, the confocalDT IFD2410 sets a new benchmark in precise confocal measurement technology.

## Intelligent technology meets high performance and user-friendliness

In Ethernet mode, the confocalDT IFD2410 can be set via the intuitive web interface. Industrial Ethernet ensures that the settings are automatically applied to the PLC environment. This eliminates time-consuming setting efforts in the programming environment.

#### Fast, precise and compact

Its high performance and compact housing make this sensor ideally suitable for series applications in production lines and machines. These include inline inspection and coordinate measuring machines, inline thickness monitoring of flat glass and container glass as well as testing electronic components.

# High performance sensor system with integrated controller confocalDT IFD2415

#### All-in-One: compact confocal sensor with high performance

The confocalDT IFD2415 is a powerful confocal sensor with integrated controller. The space-saving IP65-housing enables fast integration into plant equipment and machines as no optical fiber is required. Furthermore, the IFD2415 is ideally suited to high precision distance and thickness measurements in industrial series applications. In addition, the sensor can be used with transparent materials for multi-layer thickness measurements of up to 5 layers.

The active exposure time regulation of the CCD line enables fast and stable measurements of varying surfaces even in dynamic measurement processes up to 25 kHz. The measuring system is also characterized by high luminous intensity which enables fast and reliable measurements even on darker surfaces.

#### Intelligent technology meets high performance and user-friendliness

In Ethernet mode, the confocalDT IFD2415 can be set via the intuitive web interface. Industrial Ethernet ensures that the settings are automatically applied to the PLC environment. This eliminates time-consuming setting efforts in the programming environment.

## Fast, precise and compact

The unique combination of sensor and controller combined with excellent performance and high measuring rate make the confocalDT IFD2415 the best in its class. This compact sensor can be used in series applications such as, e.g., in inline inspection machines, robots, 3D printers and coordinate measuring machines.

# Compact confocal measuring system for industrial series applications confocalDT IFD2411

# Most compact design with highest performance and integrated Industrial Ethernet

The compact confocal IFD2411 measuring system is a factorycalibrated measuring system for industrial series applications. As well as displacement and distance measurements, the system enables even thickness measurements of transparent materials. The IFD2411 confocal chromatic measuring system is a complete channel which contains a controller and an adapted sensor with measuring ranges of 1 mm, 2 mm, 3 mm and 6 mm. Due to its favorable price/performance ratio, this measuring system is ideal for series applications.

Thanks to the integrated Industrial Ethernet interface, you integrate the controller directly into the PLC. In Ethernet mode, the controller can be set via the intuitive web interface. Industrial Ethernet ensures that the settings are automatically applied to the PLC environment. This eliminates time-consuming setting efforts in the programming environment.

## Fast, precise and robust

With an adjustable measuring rate of up to 8 kHz and sub-micrometer resolution of up to 12 nm, the IFD2411 is suitable for numerous measurement tasks. The active exposure regulation of the CCD line enables fast and reliable measurements on varying surfaces.

Thanks to its extremely compact design and its robust IP40 aluminum housing, the controller of the IFD2411 measuring system can be integrated in almost all existing plants and systems. Integrated DIN rail mounting enables fast installation in the control cabinet.

<sup>1)</sup> Average from 512 values at 1 kHz, in the mid of the mea suring range onto optical flat

 $^{\mbox{\tiny 2)}}$  RMS noise relates to mid of measuring range (1 kHz)

<sup>9</sup> All data at constant ambient temperature (25 ±1 °C) against optical flat; specifications can change when measuring different objects.
 <sup>9</sup> Maximum measuring angle of the sensor that produces a usable signal on reflecting surfaces. The accuracy decreases when approaching the limit values.
 <sup>9</sup> Glass sheet with refractive index n = 1.5 throughout the entire measuring range. In the mid of the measuring range, also thinner layers can be measured.

6) Sensor weight without optical fiber

# The new confocal controller for industrial applications confocalDT IFC242x

The confocalDT 2421/22 controllers set the industrial standard in precise, confocal measurement technology. Available as either a single- or a dual-channel version, these measuring systems are a low cost solution especially for serial applications. The active exposure regulation of the CCD line enables fast and accurate compensation of varying surfaces.

The controller can be operated with any IFS sensor and is available as a standard version for distance and thickness measurements or as a multi-peak version for multi-layer measurements. Using a special calculation function, the confocalDT 2422 dual-channel version evaluates both channels. Measurement acquisition is synchronous and can be carried out while exploiting the full measuring rate for both channels.

Due to a user-friendly web interface, no additional software is necessary to configure the controller and the sensors. Data output is via Ethernet, EtherCAT, RS422 or analog output.

Settings are made via the web interface. For thickness measurements, materials are stored in an expandable materials database.

Two sensors can be directly connected to a confocal IFC2422 controller.

IFC2422 Controller

# Light-intensive controller for high speed measurements confocalDT IFC246x

The confocalDT 2465 and 2466 controllers enable fast, high-precision distance and thickness measurements up to 30 kHz. The controllers are available as a single- or dual-channel variant. Using a special calculation function, the confocalDT 2466 dual-channel version evaluates both channels. Measurement acquisition is synchronous and can be carried out while exploiting the full measuring rate for both channels.

Available as a standard version for distance and thickness measurements as well as a multi-peak version, the controllers are compatible with all sensor types of the IFS series. The multi-peak models are used for the thickness measurement of up to 5 transparent layers.

Due to a user-friendly web interface, no additional software is necessary to configure the controller and the sensors. Data output is via Ethernet, EtherCAT, RS422 or analog output. Optionally available interface modules enable the data to be output also via PROFINET or EtherNet/IP.

## High luminous intensity for challenging measuring objects

A controller version with high light intensity is available for measuring low-reflecting objects. Especially with tilted or dark surfaces, the enhanced light intensity increases the proportion of reflected light and enables stable measurements.

Settings are made via the web interface. For thickness measurements, materials are stored in an expandable materials database.

# Cable concepts for every application

The connection options are diverse and can be adapted to your plant or machine concept.

# The confocalDT system consists of:

- Sensor IFS240x
- Controller IFC24xx
- Fiber optic cable C24xx

# Customer-specific modifications confocalDT

#### Customer-specific modifications

Application examples are often found where the standard versions of the sensors and the controllers are performing at their limits. To facilitate such special tasks, it is possible to customize the sensor design and to adjust the controller accordingly. Common requests for modifications include changes in design, mounting options, customized cable lengths and modified measuring ranges.

### Possible modifications

- Sensors with connector
- Cable length
- Vacuum suitability up to UHV
- Specific lengths
- Customer-specific mounting options
- Optical filter for ambient light compensation
- Housing material
- Measuring range / Offset distance

# Accessories Adjustable mounting adapters

JMA-xx mounting adapter for distance measurements

JMA-Thickness mounting adapter for two-sided thickness measurements

The adjustable JMA mounting adapter simplifies the alignment and fine adjustment of confocal sensors. The sensors are integrated and aligned directly in the machine together with the adapter. This corrects, e.g, minor deviations caused by mounting and compensates for tilted measuring objects. With two-sided thickness measurements, the JMA-Thickness mounting adapter supports the fine alignment of the two measuring points.

# Positioning

Shifting the sensor to target area

# Accessories Mounting adapter for two-sided thickness measurements

dululul

Optimal alignment of the optical axes enables high precision in two-sided thickness measurements

Pre-assembled for easy installation and fast commissioning

Ideally suitable for machine integration

For two-sided thickness measurements, the JMA-Thickness mounting adapter supports the alignment of the measuring points to one another. This means that the measuring points are arranged absolutely congruent to each other so that the sensors are positioned exactly on an optical axis. This prevents measurements at an offset and a reliable measurement result is achieved with the highest possible precision.

When delivered, the two mounting adapters are pre-mounted on a mounting plate and aligned with one another. This simplifies installation and the measuring system can be put into operation more quickly. After installation into the machine, the plate can be removed, if necessary.

# IF2001/USB converter RS422 to USB

The RS422/USB converter converts the digital signals of a confocal controller into a USB data packet. The sensor and the converter are connected via the RS422 interface of the converter. Data output is done via USB interface. The converter loops through further signals and functions such as laser on/off, switch signals and function output. The connected controllers and the converter can be programmed through software.

### Special features

- Robust aluminum housing
- Easy sensor connection via screw terminals (plug and play)
- Conversion from RS422 to USB
- Supports baud rates from 9.6 kBaud to 12 MBaud

#### IF2004/USB: 4-channel converter from RS422 to USB

The RS422/USB converter is used for transforming digital signals of up to four confocal controllers into USB data signals. The converter has four trigger inputs and a trigger output for connecting additional converters. Data is output via an USB interface. The connected controllers and the converter can be programmed through software. The COM interfaces can be used individually and can be switched.

## Special features

- 4x digital signals via RS422
- 4x trigger inputs, 1x trigger output
- Synchronous data acquisition
- Data output via USB

# IF2008/ETH IF2008/ETH Interface module for Ethernet connection with up to 8 sensors

The IF2008/ETH integrates up to eight sensors and/or encoders with an RS422 interface into an Ethernet network. Four programmable switching in-/outputs (TTL and HTL logic) are available.

10 indicator LEDs directly on the module show both the channel and the device status. In addition, acquisition and output of data via Ethernet is in addition performed at high speeds up to 200 kHz. Parameter setting of the interface module can be easily done via the web interface.

## IF2008PCIe/IF2008E

#### Interface card for synchronous data acquisition

Absolute synchronous data acquisition is a decisive factor for the deflection or straightness measurement using several controllers. The IF2008PCIe interface card is designed for installation in PCs and enables the synchronous acquisition of four digital sensor signals and two encoders. The data is stored in a FIFO memory in order to enable resource-saving processing in blocks in the PC. The IF2008E expansion board enables to detect in addition two digital controller signals, two analog controller signals and eight I/O signals.

## Special features

- IF2008PCIe Basic printed circuit board: 4 digital signals and 2 encoders
- IF2008E Expansion board: 2x digital signals, 2x analog signals and 8x I/O signals

#### IF2035

### Interface module for Industrial Ethernet connection

The IF2035 interface modules are designed for easy connection of Micro-Epsilon sensors to Ethernet-based fieldbuses. The IF2035 is compatible with sensors that output data via an RS422 or RS485 interface and supports the common Industrial Ethernet protocols EtherCAT, PROFINET and EtherNet/IP.

These modules operate on the sensor side with up to 4 MBd and have two network connections for different network topologies. In addition, the IF2035-EtherCAT offers a 4-fold oversampling function, which enables faster measurements than the bus cycle allows, if required. Installation in control cabinets is via a DIN rail.
