

# More Precision

wireSENSOR // Draw-wire displacement sensors

#### wireSENSOR

- Measuring ranges up to 50,000mm
- Resolution towards infinity
- Compact overall design
- Easy mounting for any application
- High reliability and long life cycle
- Analog and digital outputs

#### Principle

Draw-wire displacement sensors measure linear movements using a highly flexible steel cable. The cable drum is attached to a sensor element which provides a proportional output signal. Measurements are performed with high accuracy and high dynamic response. The use of high quality components guarantees a long life cycle and high operational reliability.

MICRO-EPSILON offers a large range of draw-wire displacement sensors equipped with different output signal types and

therefore the ideal sensor for any customerspecific application. We also develop and produce individual OEM models for special applications involving high volumes. The wire-SENSOR models stand out due to an optimal measuring range/size ratio as well as easy installation and handling. The rugged sensor construction ensures reliable operation even under difficult ambient conditions.

# Rugged draw-wire mechanics for encoder mounting

The wireSENSOR mechanics of the Z60, P96, P115 and P200 series are designed for easy mounting of an incremental or absolute encoder. The selection of the interface, resolution and type of connection can therefore be individually configured. Optimum matching to the signal conditioning system is ensured. High precision components and a rugged housing offer high operational reliability and a long life time even under harsh industrial conditions.

A complete measurement unit always consists of the basic draw-wire mechanism and the adapter for the customer-specific encoder. The adapter contains all the necessary mounting accessories for fitting the encoder and is included in delivery of the P96, P115 and P200 series.

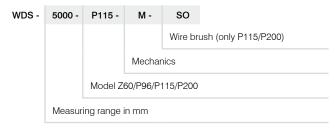

For the customer-specific encoder or potentiometer various draw-wire mechanics are available with measuring ranges up to 50m.

#### Sensitivity characteristics MK88

The WPS-2300-MK88-M is designed with only one wire layer which is wound onto the drum. This sensor design achieves the highest measurement accuracy.

If a reduced measurement accuracy is sufficient, larger measuring ranges can be achieved with the same sensor dimensions. This can be seen by means of a sensitivity characteristics (see diagram).

| Accessories: |   |
|--------------|---|
| WE-xxxx-M4   | Wire extension with M4-wire connection, x=length  |
| WE-xxxx-Clip | Wire extension with eyelet, x=length  |
| TR1-WDS      | Pulley wheel, adjustable  |
| TR3-WDS      | Pulley wheel, fixed   |
| GK1-WDS      | Attachment head for M4  |
| MH1-WDS      | Magnetic holder for wire mounting   |
| MH2-WDS      | Magnetic holder for sensor mounting   |
| MT-60-WDS    | Mounting clamp for WDS-P60  |
| FC8          | Female connector for WDS, 8-pin   |
| FC8/90       | Female connector 90° for WDS  |
| PC 3/8-WDS   | Sensor cable, length 3m   |
| PS 2020      | (Power Supply 24 V / 2,5 A, Input 100 - 240 VAC, output 24 VDC / 2.5 A, for snap in mounting on DIN 50022 rail) |
| WDS-MP60     | Mounting plate for P60 sensors  |

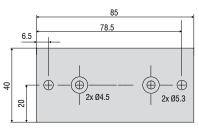

#### Installation information:

Wire attachment: The free return of the measurement wire is not permissible and it is essential that this is avoided during installation.

#### Wire exit angle:

When mounting a draw-wire displacement sensor, a straight wire exit ( $\pm 3^{\circ}$  tolerance) must be taken into account. If this tolerance is exceeded, increased material wear on the wire and at the wire aperture must be expected.

Mounting plate WDS-MP60

| 2 GND                               | Encoder ground connection. The voltage drawn to GND is UB.  |  |  |
| 3 Pulses +                          | Positive SSI pulse input. Pulse + forms a current loop with pulse A current of approx. 7 mA in direction of pulse + input generates a logical 1 in positive logic.  |  |  |
| 4 Data +                            | Positive, serial data output of the differential line driver. A High level at the output corresponds to logical 1 in positive logic.  |  |  |
| 5 ZERO                              | Zero setting input for setting a zero point at any desired point within the entire resolution. The zeroing process is triggered by a High pulse (pulse duration ≥100 ms) and must take place after the rotating direction selection (UP/DOWN). For maximum interference immunity, the input must be connected to GND after zeroing.   |  |  |
| 6 Data -                            | Negative, serial data output of the differential line driver.<br>A High level at the output corresponds to logical 0 in<br>positive logic.  |  |  |
| 7 Pulses -                          | Negative SSI pulse input. Pulse - forms a current loop with pulse +. A current of approx. 7 mA in direction of pulse - input generates a logical 0 in positive logic.   |  |  |
| 8 / 10<br>DATAVALID<br>DATAVALID MT | Diagnosis outputs $\overline{DV}$ and $\overline{DV}$ MT Jumps in data word, e.g. due to defective LED or photoreceiver, are displayed via the DV output. In addition, the power supply of the multiturn sensor unit is monitored and the DV MT output is set when a specified voltage level is dropped below. Both outputs are Low-active, i.e. are switched through to GND in the case of an error. |  |  |
| 9 UP/DOWN                           | UP/DOWN counting direction input. When not connected, this input is on High. UP/ DOWN-High means increasing output data with a clockwise shaft rotating direction when looking at the flange. UP/ DOWN-Low means increasing values with a counter-clockwise shaft rotating direction when looking at the flange.  |  |  |
| 11 / 12                             | Not in use  |  |  |

# Output specifications CANopen

| CANopen features                     |   |
|--------------------------------------|---|
| Bus protocol                         | CANopen   |
| Device profile                       | CANopen - CiA DSP 406, V 3.0  |
| CANopen Features                     | Device Class 2, CAN 2.0B  |
| Operating modes<br>(with SDO progr.) | Polling Mode (asynch, via SDO)  Cyclic Mode (asynch-cyclic) The encoder cyclically sends the current process actual value without a request by a master. The cycle time can be parameterized for values between 1 and 65535 ms. Synch Mode (synch-cyclic) The encoder sends the current actual process value after receiving a synch telegram sent by a master. The synch counter in the encoder can be parameterized so that the position value is not sent until after a defined number of synch telegrams.  Acyclic Mode (synch-acyclic) |
| Preset value                         | With the "Preset" parameter the encoder can be set to a desired actual process value that corresponds to the defined axis position of the system. The offset value between the encoder zero point and the mechanical zero point of the system is saved in the encoder.  |
| Rotating direction                   | With the operating parameter the rotating direction in which the output code is to increase or decrease can be parameterized. Scaling The steps per revolution and the total revolution can be parameterized.   |
| Scaling                              | The steps per revolution and the total revolution can be parameterized.   |
| Diagnose                             | The encoder supports the following error messages: - Position and parameter error - Lithium cell voltage at lower limit (Multiturn)   |
| Default setting                      | 50kbit/s, node number 1   |
