Universal Variable Speed AC Drive for induction and servo motors

Part Number: 0471-0122-02

Issue: 2

www.controltechniques.com

#### General Information

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation or adjustment of the optional operating parameters of the equipment or from mismatching the variable speed drive with the motor.

The contents of this guide are believed to be correct at the time of printing. In the interests of a commitment to a policy of continuous development and improvement, the manufacturer reserves the right to change the specification of the product or its performance, or the contents of the guide, without notice.

All rights reserved. No parts of this guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by an information storage or retrieval system, without permission in writing from the publisher.

#### **Drive software version**

This product is supplied with the latest software version. If this drive is to be connected to an existing system or machine, all drive software versions should be verified to confirm the same functionality as drives of the same model already present. This may also apply to drives returned from a Control Techniques Service Centre or Repair Centre. If there is any doubt please contact the supplier of the product.

The software version of the drive can be checked by looking at Pr **11.29** and Pr **11.34**. This takes the form of xx.yy.zz where Pr **11.29** displays xx.yy and Pr **11.34** displays zz. (e.g. for software version 01.01.00, Pr **11.29** = 1.01 and Pr **11.34** displays 0).

### **Environmental statement**

Control Techniques is committed to minimising the environmental impacts of its manufacturing operations and of its products throughout their life cycle. To this end, we operate an Environmental Management System (EMS) which is certified to the International Standard ISO 14001. Further information on the EMS, our Environmental Policy and other relevant information is available on request, or can be found at www.greendrives.com.

The electronic variable-speed drives manufactured by Control Techniques have the potential to save energy and (through increased machine/process efficiency) reduce raw material consumption and scrap throughout their long working lifetime. In typical applications, these positive environmental effects far outweigh the negative impacts of product manufacture and end-of-life disposal.

Nevertheless, when the products eventually reach the end of their useful life, they must not be discarded but should instead be recycled by a specialist recycler of electronic equipment. Recyclers will find the products easy to dismantle into their major component parts for efficient recycling. Many parts snap together and can be separated without the use of tools, while other parts are secured with conventional fasteners. Virtually all parts of the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates, while smaller products come in strong cardboard cartons which themselves have a high recycled fibre content. If not re-used, these containers can be recycled. Polythene, used on the protective film and bags for wrapping product, can be recycled in the same way. Control Techniques' packaging strategy prefers easily-recyclable materials of low environmental impact, and regular reviews identify opportunities for improvement.

When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

## **REACH legislation**

EC Regulation 1907/2006 on the Registration, Evaluation, Authorisation and restriction of Chemicals (REACH) requires the supplier of an article to inform the recipient if it contains more than a specified proportion of any substance which is considered by the European Chemicals Agency (ECHA) to be a Substance of Very High Concern (SVHC) and is therefore listed by them as a candidate for compulsory authorisation.

For current information on how this requirement applies in relation to specific Control Techniques products, please approach your usual contact in the first instance. Control Techniques position statement can be viewed at: http://www.controltechniques.com/REACH

## How to use this guide

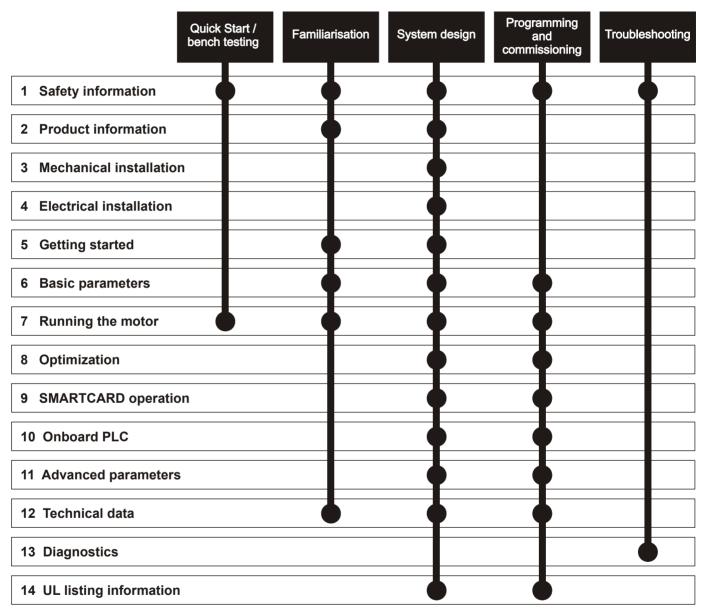

This user guide provides complete information for installing and operating the drive from start to finish.

The information is in logical order, taking the reader from receiving the drive through to fine tuning the performance.

#### NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 *Safety information* contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to the table of contents overleaf.

The AC variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

EN 61800-5-1:2007	Adjustable speed electrical power drive systems - safety requirements - electrical, thermal and energy
EN 61800-3:2004	Adjustable speed electrical power drive systems. EMC product standard including specific test methods
EN 61000-6-2:2005	Electromagnetic compatibility (EMC). Generic standards. Immunity standard for industrial environments

These products comply with the Low Voltage Directive 2006/95/EC and the Electromagnetic Compatibility Directive 2004/108/EC.

T.Alexander

**Executive Vice President, Technology** 

om alend

Newtown

Date: 14th July 2009

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters. The drives must be installed only by professional assemblers who are familiar with requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used. Refer to the User Guide. An EMC Data Sheet is also available giving detailed EMC information.

## **Declaration of Conformity (including 2006 Machinery Directive)**

**Control Techniques Ltd** 

The Gro

Newtown

**Powys** 

UK

**SY16 3BE** 

Moteurs Leroy-Somer Usine des Agriers Boulevard Marcellin Leroy CS10015 16915 Angoulême Cedex 9 France

This declaration applies to the Unidrive SP and Digitax ST variable speed drive product ranges, comprising model numbers composed as shown below.:

SP(ab)cdet	f Valid characters:	<b>DST</b> abcde Valid characters:				
ab	Absent, MA or MD	а	1			
С	0123456789	b	2 4			
d	2456	С	0			
е	0 1 2 3	d	12345			
f	1234567	е	BIPZ			

This declaration relates to these products when used as a safety component of a machine. Only the SAFE TORQUE OFF function may be used for a safety function of a machine. None of the other functions of the drive may be used to carry out a safety function.

These products fulfil all the relevant provisions of Directive 2006/42/EC (The Machinery Directive). They also fulfil all the relevant provisions of Directives 2004/108/EC (The EMC Directive) and 2006/95/EC (The Low Voltage Directive).

EC type-examination has been carried out by the following notified body:  $IF\Delta$ 

Alte Heerstraße 111 53757 Sankt Augustin Germany.

Notified Body identification number: 0121 EC type-examination certificate number: IFA 1001123

The schedule attached to the certificate specifies the product model numbers which have been subjected to type examination.

The harmonised standards used are shown below:

DIN EN 61800-5-1:2008	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy
DIN EN 61800-5-2:2008	Adjustable speed electrical power drive systems. Safety requirements. Functional
DIN EN ISO 13849- 1:2008	Safety of machinery. Safety-related parts of control systems. General principles for design
DIN EN ISO 13849- 2:2008	Safety of machinery. Safety-related parts of control systems. Validation

#### IMPORTANT NOTICE

These drive products are intended to be used with appropriate motors, sensors, electrical protection components and other equipment to form complete systems. It is the responsibility of the installer to ensure that the design of the complete machine, including its safety-related control system, is carried out in accordance with the requirements of the Machinery Directive and any other relevant legislation. The use of a safety-related drive in itself does not ensure the safety of the machine.

Compliance with safety and EMC regulations depends upon installing and configuring inverters correctly. The inverters must be installed only by professional assemblers who are familiar with requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used. Refer to the User Guide.

## Safety information

#### 1.1 Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

WARNING

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

#### NOTE

A Note contains information which helps to ensure correct operation of

#### 1.2 Electrical safety - general warning

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive.

Specific warnings are given at the relevant places in this User Guide.

#### 1.3 System design and safety of personnel

The drive is intended as a component for professional incorporation into complete equipment or a system. If installed incorrectly, the drive may present a safety hazard.

The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause

Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction. System design, installation, commissioning/ start-up and maintenance must be carried out by personnel who have the necessary training and experience. They must read this safety information and this User Guide carefully.

The STOP and SAFE TORQUE OFF functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit. The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

With the sole exception of the SAFE TORQUE OFF function, none of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.

Careful consideration must be given to the functions of the drive which might result in a hazard, either through their intended behavior or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

The SAFE TORQUE OFF function has been approved by BGIA as meeting the requirements of the following standards, for the prevention of unexpected starting of the drive:

EN 61800-5-2:2007 SIL 3

EN ISO 13849-1:2006 PL e

EN 954-1:1997 Category 3

The SAFE TORQUE OFF function may be used in a safety-related application. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards.

#### 1.4 **Environmental limits**

Instructions in this User Guide regarding transport, storage, installation and use of the drive must be complied with, including the specified environmental limits. Drives must not be subjected to excessive physical force.

#### 1.5 Access

Drive access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

#### 1.6 Fire protection

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided. For further information, refer to section 3.2.5 Fire protection on page 23.

## Compliance with regulations

The installer is responsible for complying with all relevant regulations. such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective earth (ground) connections.

This User Guide contains instruction for achieving compliance with specific EMC standards.

Within the European Union, all machinery in which this product is used must comply with the following directives:

2006/42/EC: Safety of machinery.

2004/108/EC: Electromagnetic Compatibility.

#### 1.8 Motor

Ensure the motor is installed in accordance with the manufacturer's recommendations. Ensure the motor shaft is not exposed.

Standard squirrel cage induction motors are designed for single speed operation. If it is intended to use the capability of the drive to run a motor at speeds above its designed maximum, it is strongly recommended that the manufacturer is consulted first.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive should not be relied upon.

It is essential that the correct value is entered in parameter 0.46 motor rated current. This affects the thermal protection of the motor.

#### 1.9 Mechanical brake control

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury. independent protection devices of proven integrity must also be incorporated.

#### 1.10 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

### 1.11 Electrical installation

#### 1.11.1 Electric shock risk

The voltages present in the following locations can cause severe electric shock and may be lethal:

AC supply cables and connections

Output cables and connections

Many internal parts of the drive, and external option units

Unless otherwise indicated, control terminals are single insulated and must not be touched.

### 1.11.2 Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

## 2 Product information

Unidrive SP Free Standing cubicles comprise one or more SPM modules (SPMA / SPMD / SPMC), depending on size and current ratings.

#### 2.1 Model number

The way in which the model numbers for the Unidrive SP range are formed is illustrated below.

Figure 2-1 Unidrive SP Free Standing size 6 and 7 order codes

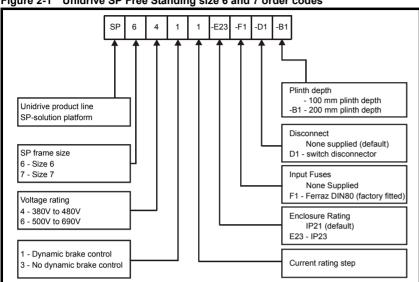

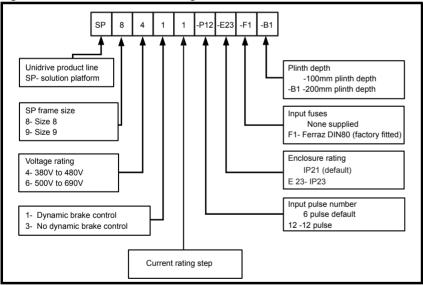

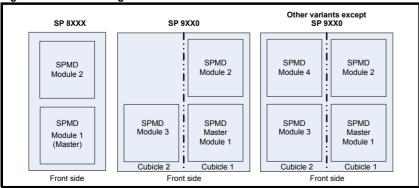

Figure 2-2 Unidrive SP Free Standing size 8 and 9 order codes

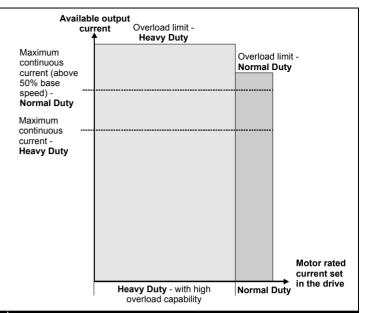

Safety Product Mechanica Electrical SMARTCARE Advanced **UL** Listing Optimization Diagnostics information information installation Installation started parameters the motor operation PLC parameters data information

## 2.2 Ratings

The Unidrive SP is dual rated.

The setting of the motor rated current determines which rating applies - Heavy Duty or Normal Duty.

The two ratings are compatible with motors designed to IEC60034. The graph aside illustrates the difference between Normal Duty and Heavy Duty with respect to continuous current rating and short term overload limits.

#### **Normal Duty**

For applications which use Self ventilated (TENV/TEFC) induction motors and require a low overload capability, and full torque at low speeds is not required (e.g. fans, pumps).

Self ventilated (TENV/TEFC) induction motors require increased protection against overload due to the reduced cooling effect of the fan at low speed. To provide the correct level of protection the  $\rm I^2t$  software operates at a level which is speed dependent. This is illustrated in the graph below.

#### NOTE

The speed at which the low speed protection takes effect can be changed by the setting of Pr 4.25. The protection starts when the motor speed is below 15% of base speed when Pr 4.25 = 0 (default) and below 50% when Pr 4.25 = 1.

## **Heavy Duty (default)**

For constant torque applications or applications which require a high overload capability, or full torque is required at low speeds (e.g. winders, hoists).

The thermal protection is set to protect force ventilated induction motors and permanent magnet servo motors by default.

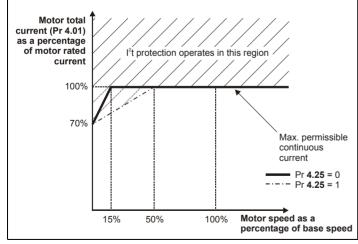

#### NOTE

If the application uses a self ventilated (TENV/TEFC) induction motor and increased thermal protection is required for speeds below 50% base speed, then this can be enabled by setting Pr **4.25** = 1.

## Operation of motor I<sup>2</sup>t protection (It.AC trip)

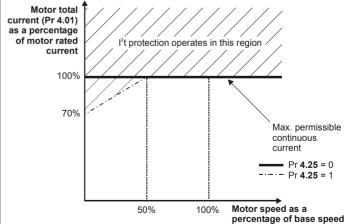

Motor I<sup>2</sup>t protection is fixed as shown below and is compatible with:

Self ventilated (TENV/TEFC) induction motors

Motor I<sup>2</sup>t protection defaults to be compatible with:

- Forced ventilation induction motors
- Permanent magnet servo motors

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostica	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

The continuous current ratings given are for maximum 40°C (104°F) for the standard drive and 33°C (91°F) for the IP23 variant, 1000m altitude and 3.0kHz switching. Derating is required for higher switching frequencies, higher ambient temperatures and high altitude. For further information, refer to section 12.1.1 *Power and current ratings (Derating for switching frequency and temperature)* on page 229.

#### NOTE

With regard to Figure 2-1 to Figure 2-4, derating is applied to all drives at low output frequencies. Please contact the supplier of the drive for more information if the application requires significant torque, at or close to zero speed for extended periods of time or if prolonged periods of overload (>100%) are required.

information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

#### 2.2.1 Typical short term overload limits

The maximum percentage overload limit changes depending on the selected motor. Variations in motor rated current, motor power factor and motor leakage inductance all result in changes in the maximum possible overload. The exact value for a specific motor can be calculated using the equations detailed in Menu 4 in the *Advanced User Guide*.

Typical values are shown in the table below for closed loop vector (VT) and open loop (OL) modes:

Table 2-4 Typical overload limits for size 6 to 9

Operating mode	Closed loop from cold	Closed loop from 100%	Open loop from cold	Open loop from 100%
Normal Duty overload with motor rated current = drive rated current	110% for 165s	110% for 9s	110% for 165s	110% for 9s
Heavy Duty overload with motor rated current = drive rated current	150% for 60s	150% for 8s	129% for 97s	129% for 15s

Generally the drive rated current is higher than the matching motor rated current allowing a higher level of overload than the default setting.

The time allowed in the overload region is proportionally reduced at very low output frequency on some drive ratings.

#### NOTE

The maximum overload level which can be attained is independent of the speed.

### 2.3 Operating modes

The Unidrive SP is designed to operate in any of the following modes:

1. Open loop mode

Open loop vector mode Fixed V/F mode (V/Hz) Quadratic V/F mode (V/Hz)

- 2. RFC mode
- Closed loop vector Servo
- 4. Regen

#### 2.3.1 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

For further details refer to section 8.1.1 *Open loop motor control* on page 115.

#### Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100% torque is available down to 1Hz for a 50Hz motor.

#### Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100% torque is available down to 4Hz for a 50Hz motor.

#### Quadratic V/F mode

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

#### 2.3.2 RFC mode

Rotor flux control provides closed loop control without the need for position feedback by using current, voltages and key motor parameters to estimate the motor speed. It can eliminate instability traditionally associated with open loop control such as operating large motors with light loads at low frequencies.

For further details, refer to section 8.1.2 RFC mode on page 117.

#### 2.3.3 Closed loop vector mode

For use with induction motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded. Motor flux is accurately controlled at all times to provide full torque all the way down to zero speed.

#### 2.3.4 Servo

For use with permanent magnet brushless motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded. Flux control is not required because the motor is self excited by the permanent magnets which form part of the rotor.

Absolute position information is required from the feedback device to ensure the output voltage is accurately matched to the back EMF of the motor. Full torque is available all the way down to zero speed.

#### 2.3.5 Regen

Free Standing drives are not intended to be used in regen mode.

## 2.4 Compatible encoders

Table 2-5 Encoders compatible with Unidrive SP

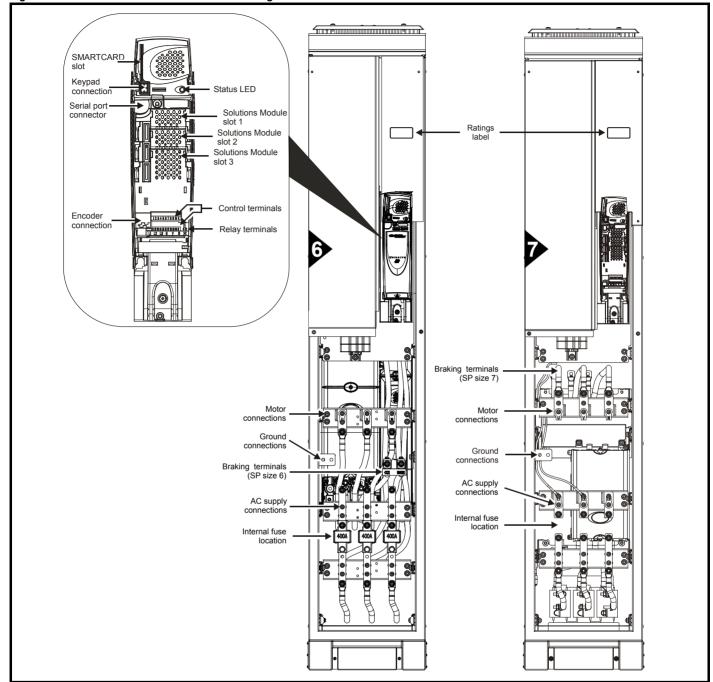

·									
Encoder type	Pr 3.38 setting								
Quadrature incremental encoders with or without marker pulse	Ab (0)

## 2.8 Items supplied with the drive

The drive is supplied with a printed manual, a SMARTCARD, a safety information booklet, the Certificate of Quality and a CD ROM containing all related product documentation and software tools. All accessories (e.g. control connectors) are supplied installed to the drive.

Safety Product information installation installation installation in the parameters in the motor of the motor information in the motor information in the motor in the motor operation in the motor operation in the motor operation operation operation in the motor operation oper

## 3 Mechanical installation

This chapter describes how to use all mechanical details to install the drive. Key features of this chapter include:

- · Baying of Free Standing drives
- · Terminal location and torque settings
- · Solutions Module installation

## 3.1 Safety information

Follow the instructions

The mechanical and electrical installation instructions must be adhered to. Any questions or doubt should be referred to the supplier of the equipment. It is the responsibility of the owner or user to ensure that the installation of the drive and any external option unit, and the way in which they are operated and maintained, comply with the requirements of the Health and Safety at Work Act in the United Kingdom or applicable legislation and regulations and codes of practice in the country in which the equipment is used.

Competence of the installer

The drive must be installed by professional assemblers who are familiar with the requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

The weights of the size 6 to 9 Free Standing drives are as follows:

Size 6: 199 kg (438 lb)

Size 6 with integral line side options: 240kg (529 lb)

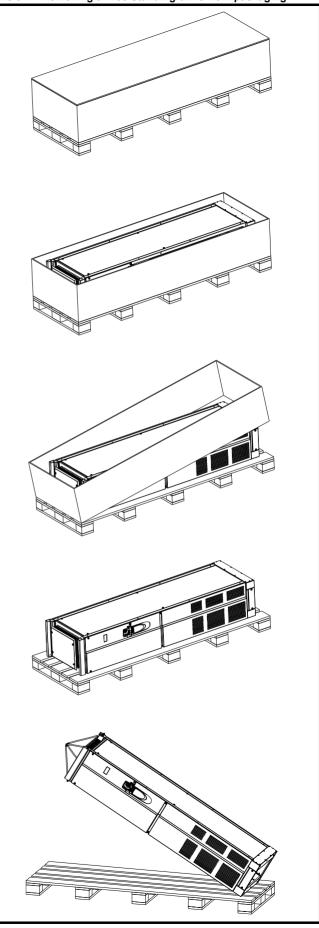

Size 7: 214 kg (471 lb)

Size 7 with integral line side options: 255kg (562 lb)

Size 8: 266 kg (586 lb) Size 9: 532 kg (1173 lb)

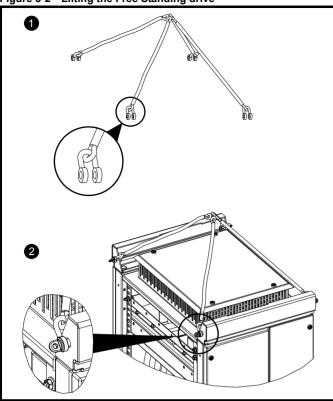

Lift the drive by the method detailed in Figure 3-2 on page 23. Do not tilt the drive. The centre of gravity of the unit is high. An overturning unit can cause physical injury.

Figure 3-1 Removing a Free Standing drive from packaging

Figure 3-2 Lifting the Free Standing drive

- Attach "D" shackles to each rope
- Attach each shackle to the lifting plate. Ensure angle of each rope is

#### 3.2 Planning the installation

The following considerations must be made when planning the installation:

#### 3.2.1 **Access**

Access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

The standard Free Standing drive is rated for IP21. An IP23 version is also available.

### **Environmental protection**

The drive must be protected from:

- Moisture, including dripping water or spraying water and
- Contamination with electrically conductive material
- Contamination with any form of dust which may restrict the fan, or impair airflow over various components
- Temperature beyond the specified operating and storage ranges
- Corrosive gasses

#### 3.2.3 Cooling

The inlet and outlet vents on the drive must not be restricted or covered. The ambient temperature must not exceed the specified operating temperature of the drive. Some size 8 and size 9 models are installed with a fan in the roof of the enclosure.

Care must be taken when installing Unidrive SP Free Standing drives side by side, to prevent recirculation of heated air. Where a Free Standing drive with no roof fan is installed next to a drive with a roof fan it is recommended that some additional baffling be added between the roof canopies to prevent recirculation of heated air in the drive with no roof fan. If no baffling is added between drives fitted with roof fans and those without a distance of 0.5 metres must be maintained between

Certain Unidrive SP size 6 and 7 Free Standing drives are fitted with smaller roof fans, baffling should also be fitted if installed side by side with a Unidrive size 8 or 9 Free Standing drive (with larger roof fan) or a distance of 0.5 metres (19.69in) must also be maintained between

A distance of 300mm (11.81in) should be maintained between the top of the Free Standing drive roof canopy and the ceiling of the room in which the Free Standing drive is installed.

Refer to Table 12-8 Roof mounted fans on page 246 for details of which Free Standing models have roof fans fitted.

#### **Electrical safety**

The installation must be safe under normal and fault conditions. Electrical installation instructions are given in Chapter 4 Electrical Installation on page 50.

#### 3.2.5 Fire protection

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided.

For installation in the USA, a NEMA 12 enclosure is suitable.

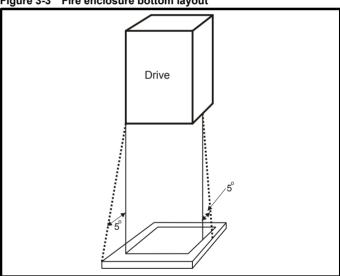

For installation outside the USA, the following (based on IEC 62109-1, standard for PV inverters) is recommended.

Enclosure can be metal and/or polymeric, polymer must meet requirements which can be summarized for larger enclosures as using materials meeting at least UL 94 class 5VB at the point of minimum thickness.

Air filter assemblies to be at least class V-2.

The location and size of the bottom shall cover the area shown in Figure 3-3. Any part of the side which is within the area traced out by the 5° angle is also considered to be part of the bottom of the fire enclosure.

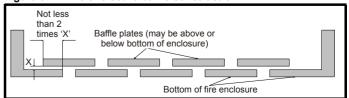

Figure 3-3 Fire enclosure bottom layout

The bottom, including the part of the side considered to be part of the bottom, must be designed to prevent escape of burning material - either by having no openings or by having a baffle construction. This means that openings for cables etc. must be sealed with materials meeting the 5VB requirement, or else have a baffle above.

See Figure 3-4 for acceptable baffle construction. This does not apply for mounting in an enclosed electrical operating area (restricted access)

Figure 3-4 Fire enclosure baffle construction

Safety Electrical SMARTCARE Advanced **UL Listing** Optimization Diagnostics information information installation Installation parameters the motor operation PLC parameters information

#### 3.2.6 Electromagnetic compatibility

Variable speed drives are powerful electronic circuits which can cause electromagnetic interference if not installed correctly with careful attention to the layout of the wiring.

Some simple routine precautions can prevent disturbance to typical industrial control equipment.

If it is necessary to meet strict emission limits, or if it is known that electromagnetically sensitive equipment is located nearby, then full precautions must be observed. In-built into the drive, is an internal EMC filter, which reduces emissions under certain conditions. If these conditions are exceeded, then the use of an external EMC filter may be required at the drive inputs, which must be located as close to the drive as possible. A suitable location, such as a SP-Incomer Shell, must be made available for the housing filters and allowance made for carefully segregated wiring. Both levels of precautions are covered in section 4.9 EMC (Electromagnetic compatibility) on page 66.

#### 3.2.7 Hazardous areas

The drive must not be located in a classified hazardous area.

#### 3.3 Terminal cover removal

Isolation device

The AC supply must be disconnected from the drive using an approved isolation device before any cover is removed from the drive or before any servicing work is performed.

Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may commence.

Normally, the capacitors are discharged by an internal resistor. Under certain, unusual fault conditions, it is possible that the capacitors may fail to discharge, or be prevented from being discharged by a voltage applied to the output terminals. If the drive has failed in a manner that causes the display to go blank immediately, it is possible the capacitors will not be discharged. In this case, consult Control Techniques or their authorized distributor.

Figure 3-5 Location and identification of terminal covers for Free Standing drives with integral line side options

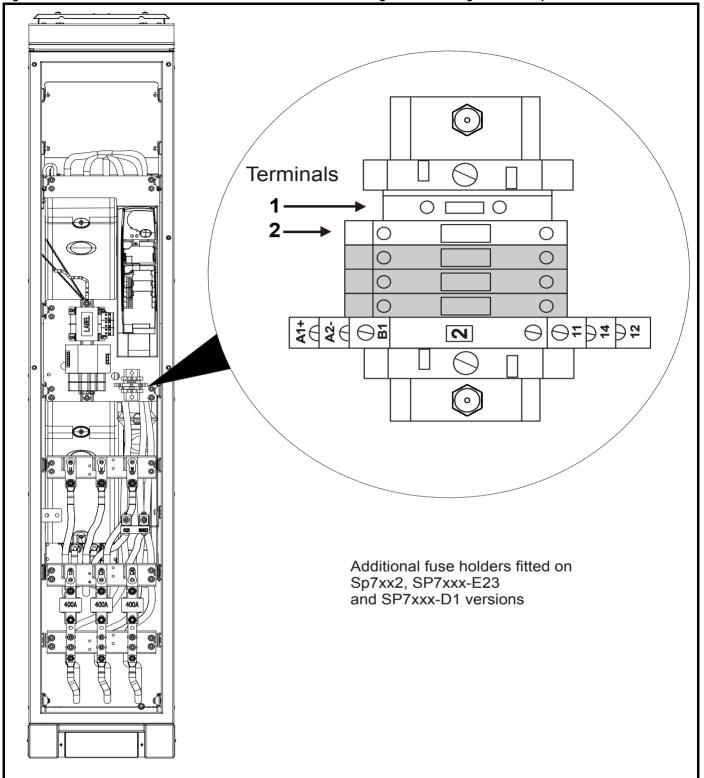

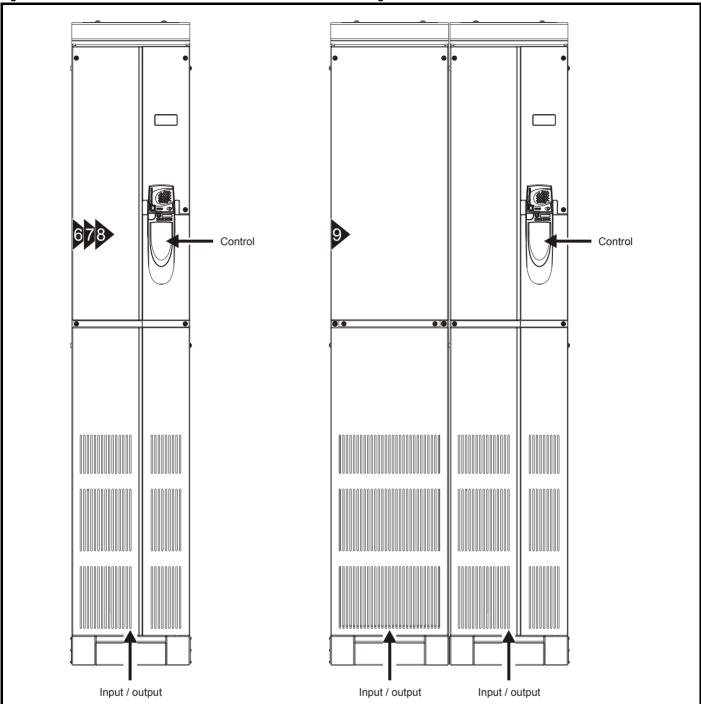

Figure 3-6 Location and identification of terminal covers for Free Standing drives

Figure 3-7 Removing the size 6, 7 and 8 terminal covers from the Free Standing drive

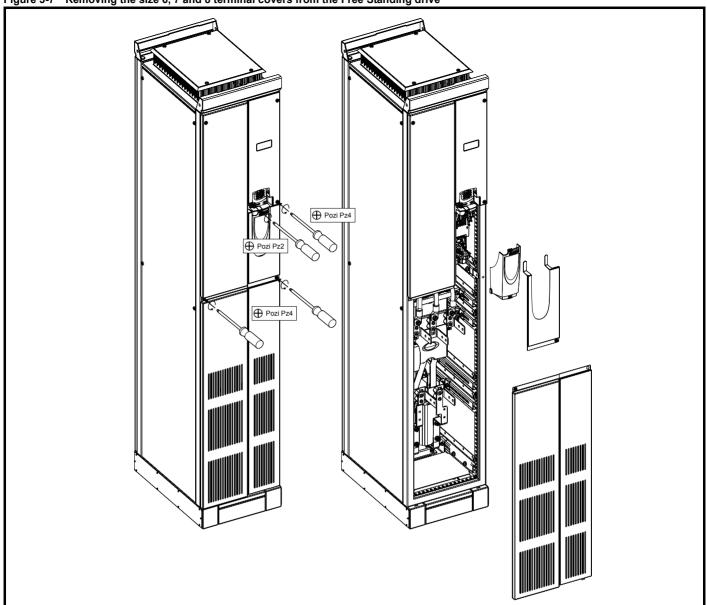

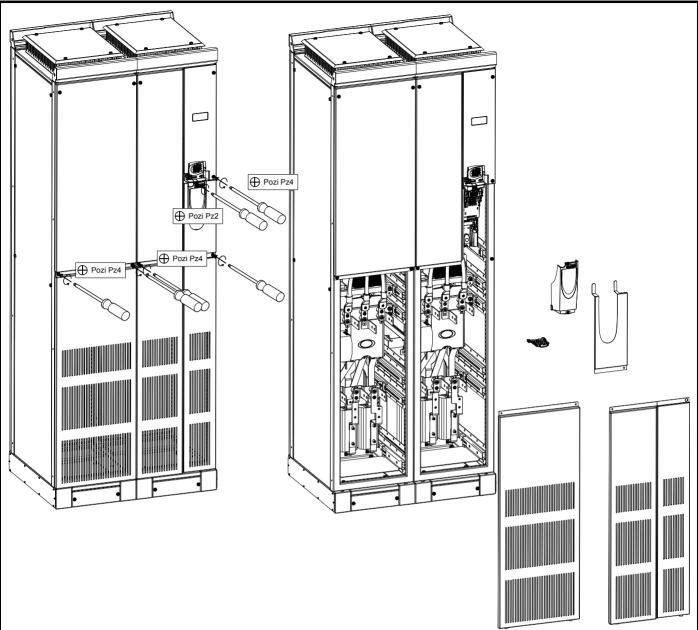

Figure 3-8 Removing the size 9 terminal covers from the Free Standing drive

## 3.4 Installing fuses in a Free Standing drive

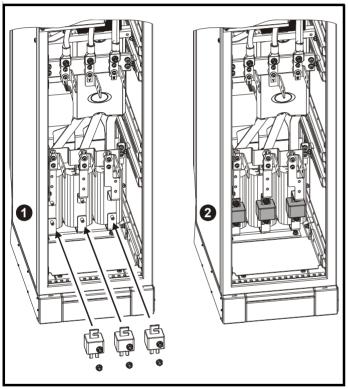

Fuses must be installed. Free Standing drives can be ordered with or without mains supply fuses. Factory fitted fuses are indicated by a -F1 suffix after the order code. See section 2.1 *Model number* on page 10 for more information on order codes. Alternatively mains supply fuses (type DIN80 only) can be purchased separately from Control Techniques. See Table 4-5 *Fuses* on page 62 for further information.

Instructions for installing fuses on 6 pulse drives are shown in shown in section 3.4.1 Sizes 6&7 or sizes 8&9 (with date code S17) on page 29. See section section Unidrive SP Free Standing cubicle frames which have a date code of S27 or later, have two additional through-holes on both vertical sides, which have been added to ease the baying process. for information on installing fuses on 12 pulse drives.

Ensure fuses are aligned with the busbar.

## 3.4.1 Sizes 6&7 or sizes 8&9 (with date code S17) Figure 3-9 Size 6&7 or sizes 8&9 with date code S17 or earlier

The six M10 nuts holding the fuses must be tightened to a torque of 12N m (8.8lb.ft)

### 3.4.2 Size 8 & 9 (with date code S18 or later)

Unidrive SP size 8 and 9 Free Standing with date code of S18 or later can accept type DIN80 or type DIN110 fuses.

Figure 3-10 Identification of fuse mounting holes

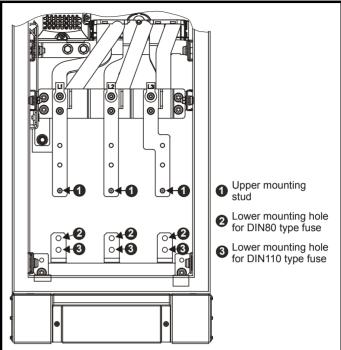

Figure 3-11 Installing DIN80 type fuses

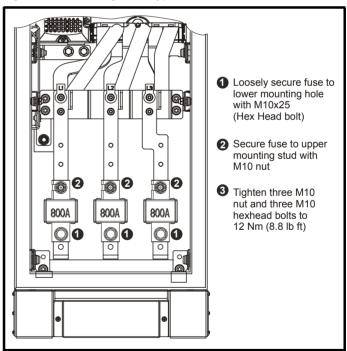

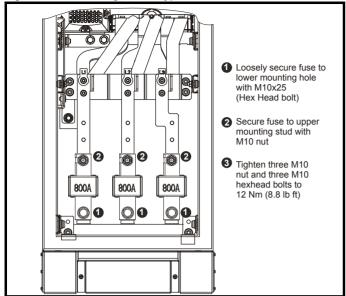

Figure 3-12 Installing DIN110 type fuses

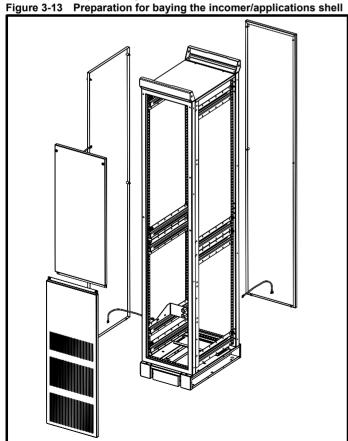

## 3.5 Baying Free Standing drives

This section describes how to connect or 'bay' the master and slave drives of a size 9 together, or an incomer to a size 8 or 9 Free Standing drive.

## 3.5.1 Preparation for baying

The following diagrams show how to prepare the incomer/applications shell and the size 8 / 9 Free Standing drives for baying.

- Remove all front, rear and side panels as shown. All screws for these are Pozi Pz4
- 2. Disconnect the ground cable connections from the front, rear and side panels by removing the M6 nuts and star washers.

An incomer shell is supplied without side panels.

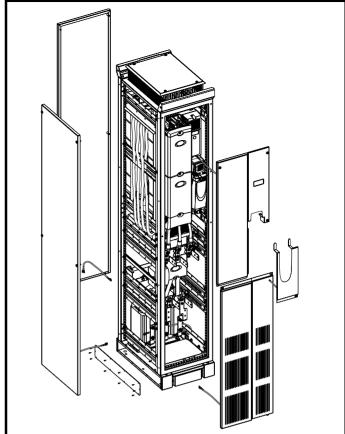

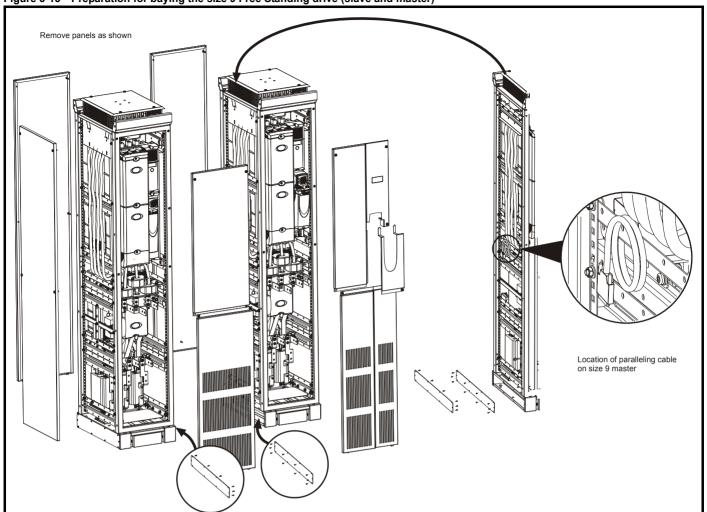

Figure 3-15 Preparation for baying the size 9 Free Standing drive (slave and master)

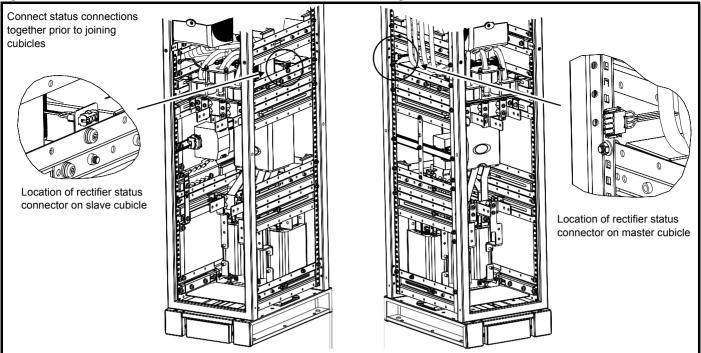

The total weight of the size 9 Free Standing drive is: 532 kg (1173 lb), i.e. 266 kg (586 lb) per enclosure.

Lift the drive by the method detailed in Figure 3-2 on page 23. Do not tilt the drive. The centre of gravity of the unit is high. An overturning unit can cause physical injury.

#### NOTE

Unidrive SP Free Standing cubicle frames which have a date code of S27 or later, have two additional through-holes on both vertical sides, which have been added to ease the baying process.

## 3.5.3 Electrical connections for baying a size 9 master to slave

Figure 3-18 Installing the parallel cable from a size 9 master to slave

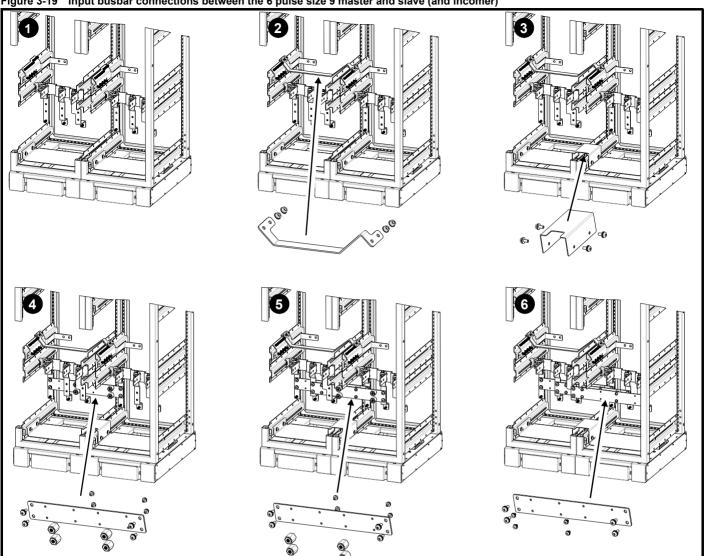

- 1. Remove size 9 slave interface cover
- 2. Connect the paralleling cable to the size 9 slave input slot
- 3. Replace size 9 slave interface cover
- 4. Replace all size 9 Free Standing drive panels

#### 6 pulse size 9 input busbar connections

Figure 3-19 Input busbar connections between the 6 pulse size 9 master and slave (and incomer)

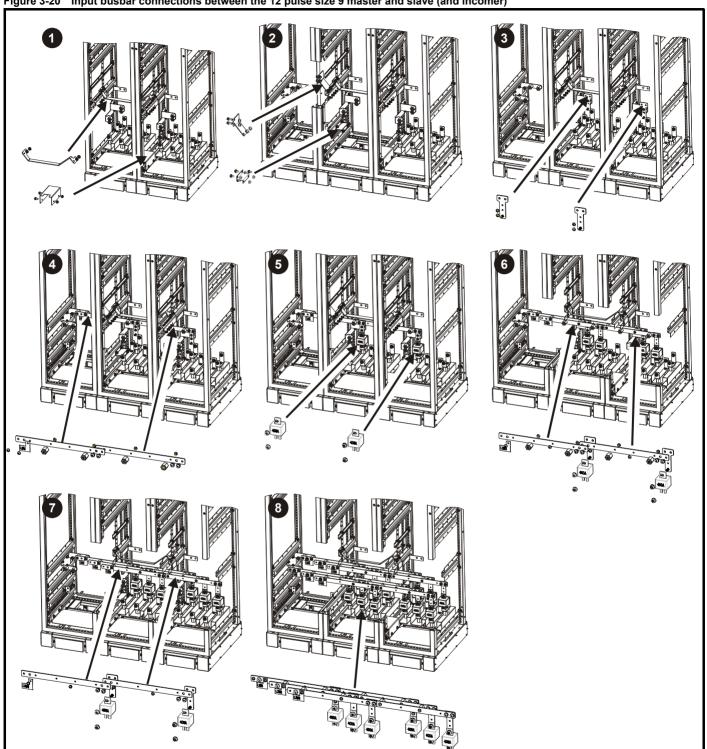

Master and slave cubicles bayed together

From the size 9 baying kit:

- 2. Fit the safety ground link with (M10 nuts) (torque 20 N m [14.75 lb ft])
- 3. Fit the incomer EMC plate with (M8 x 20 screws) (torque 12 N m [8.85 lb ft])
- 4. & 5. Fit the input parallel busbar with (M8 x 20 screws) (torque 17 N m [12.5 lb ft]); and M6 x 30 insulating spacer with (M6 x 12 screws) (torque 12 N m [8.85 lb ft])
- 6. Fit the input parallel busbar with (M8 x 20 screws) (torque 17 N m [12.5 lb ft])

#### 12 pulse size 9 input busbar connections

Figure 3-20 Input busbar connections between the 12 pulse size 9 master and slave (and incomer)

- 1. Fit the safety ground busbar (top) with supplied M10 nuts and EMC gland joining plate (bottom) with existing M8 x 20 torx screws
- 2. a) Fit the following to the size 8 or 9 slave cubicle: Safety ground busbar (top) with 2 x M10 nuts and EMC baying plate (bottom) with supplied 2 x M8 x 20 torx screws and 2 x M8 nuts
  - b) Mechanically bay the 12 pulse incomer cubicle
  - c) Complete safety and EMC ground connections: Fit supplied 2 x M10 nuts and M10 x 25 bolts to connect safety ground busbar. Also fit 2 x M8 x 20 torx screws and M8 nuts to connect EMC baying plate to 12 pulse incomer cubicle.
- 3. Fit: 2 x 12 pulse busbar fuse links with supplied M6 x 16 torx screws
- 4. Fit: 2 x 12 pulse busbars, 4 x 30mm insulator, 6 x M6 x 16 screws, 4 x M8 x 20 screws, L1(A) terminal marker

#### NOTE

Pre-fit insulators to busbars before fitting to cubicle.

5. Fit 400A fuses with 4 x M10 nuts supplied.

Safety	Product	Mechanical		Getting	Basic	Running	Optimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor		operation	PLC	parameters	data	3	information

#### NOTE

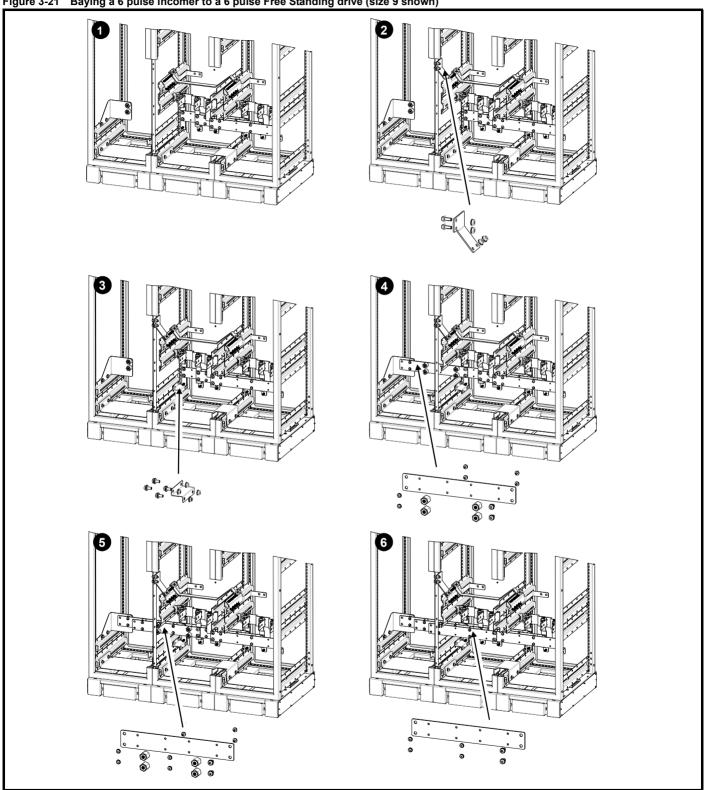

Factory fitted fuses are available as a selectable option, alternatively fuses can be ordered and supplied separately. It is recommended to fit the fuses integral with this baying procedure. The fuses can be easily independently removed should the need arise when in service.

- 6. Fit: 2 x 12 pulse busbars, 2 x 12 pulse busbar fuse links, 4 x 30mm insulators, 8 x M6 x 16 torx screws, 4 x M8 x 20 torx screws, 4 x M10 nuts to fit 400A fuses, L2(A) terminal marker
- 7. Fit: 2 x 12 pulse busbars, 2 x 12 pulse busbar fuse links, 4 x M6 x 16 torx screws, 4 x M8 x 20 torx screws, 4 x M10 nuts to fit 400A fuses, L3(A) terminal marker
- 8. Repeat procedure for fitting L1(B), L2(B) and L3(B) input busbars.

#### 3.5.4 Electrical connections for baying an incomer to size 8 and 9

The following diagrams look at specific features of baying a 6 pulse incomer to a 6 pulse drive, and baying the master and slave cabinets of a 6 pulse size 9 together. All images show the appropriate components exploded and installed.

Figure 3-21 Baying a 6 pulse incomer to a 6 pulse Free Standing drive (size 9 shown)

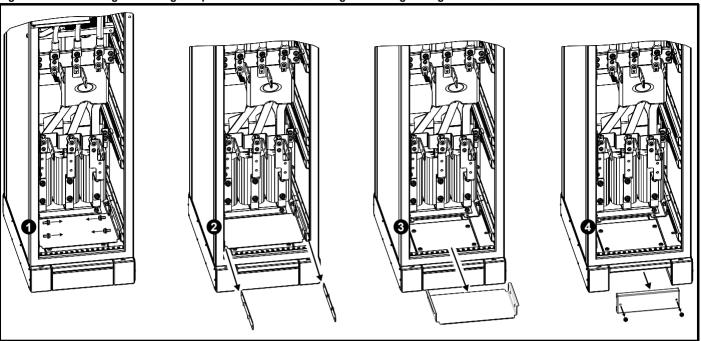

- 1. Free standing drive (size 9) and incomer cubicle bayed together. Using the incomer baying kit (6771-0026):
- Fit the safety ground link: 6771-0029 (M10 nuts and screws).
- Fit the EMC plate: 6771-0046 (M8 nuts and screws).
- Fit the input parallel busbar: 6531-0222 (M8 x 20 screws); and M6 x 30 insulating spacer: 6262-0630 (M6 x 12 screws).
- Fit the input parallel busbar: 6531-0222 (M8 x 20 screws); and M6 x 30 insulating spacer: 6262-0630 (M6 x 12 screws).
- 6. Fit the input parallel busbar: 6531-0222 (M8 x 20 screws).

# 3.5.7 Procedure for fitting IP23 roof on Free Standing drive

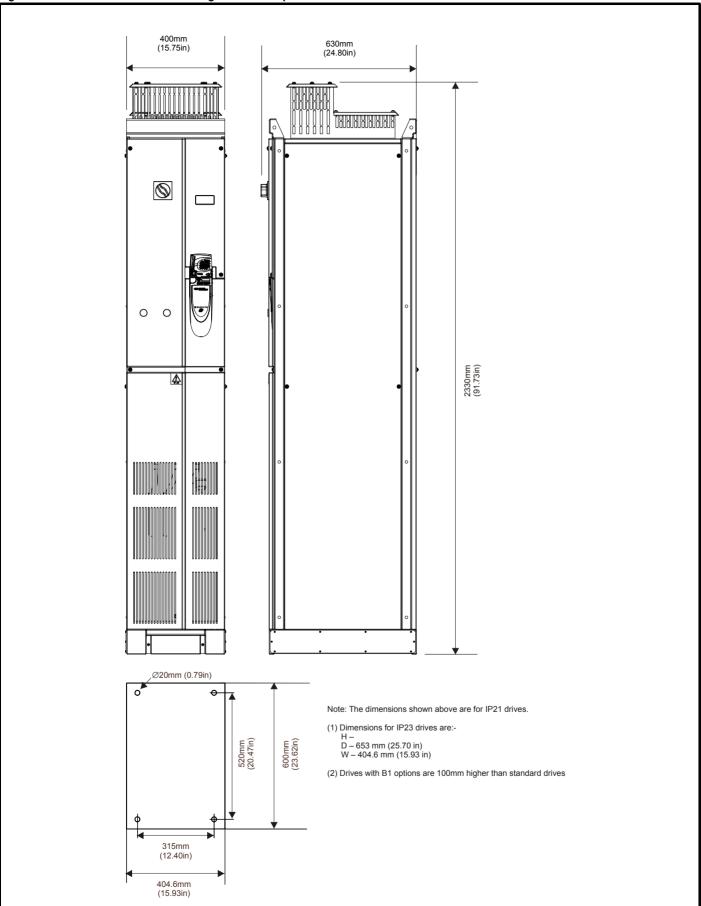

NOTE

Due to the nature of the design, the drive enclosure or complete panel cannot be lifted with the IP23 canopy in place. It is therefore a requirement that IP23 canopies are fitted on site when the drive or complete panel is in the final position.

- Fit the side plates to each end of the enclosure(s). Remove 4 plastic plugs from the enclosure frame. Loosen the two top M6 side panel screws. Fit both side plates using the M10 fasteners supplied and re tighten the M6 side panel screws.
- Prepare the IP23 canopy for fitting to the enclosure. Remove and discard the eight hole blanking plugs circled. Temporarily remove the rear cowling.
- Fit the IP23 canopy to the existing enclosure. Temporarily remove four M6 screws fastening the existing roof top plate. Mount the IP23 canopy on to the existing roof top plate. Secure the IP23 canopy using the four M6 screws previously removed in step 2.
- Replace the rear cowling. Secure using the fasteners removed in step 2.
- For Free Standing size 9 fit the remaining IP23 canopies (repeating steps 2, 3, and 4), ensuring adjacent canopies are correctly interconnected. Secure adjacent IP23 canopies using the canopy baying plates, note orientation.
- Prepare IP23 canopy for fitting to the Incomer enclosure (where applicable). Remove and discard the two hole blanking plugs circled.
- Fit IP23 canopy to Incomer enclosure (where applicable). Locate canopy onto Incomer enclosure. Join to adjacent drive enclosure using the canopy baying plates. Secure canopy to side panel with M6 screws supplied.

#### 3.6 Solutions Module / keypad installation / removal

Power down the drive before installing / removing the Solutions Module. Failure to do so may result in damage to the product.

Figure 3-28 Installation and removal of a Solutions Module

To install the Solutions Module, press down in the direction shown above until it clicks into place.

To remove the Solutions Module, press inwards at the points shown (A) and pull in the direction shown (B).

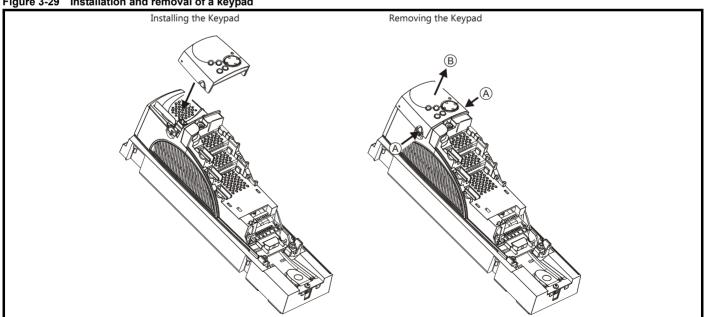

The drive has the facility for all three Solutions Module slots to be used at the same time, as illustrated.

It is recommended that the Solutions Module slots are used in the following order: slot 3, slot 2 and slot 1.

Be aware of possible live terminals when installing the keypad.

Figure 3-29 Installation and removal of a keypad

To install, align the keypad and press gently in the direction shown until it clicks into position.

To remove, while pressing the tabs inwards (A), gently lift the keypad in the direction indicated (B).

The keypad can be installed / removed while the drive is powered up and running a motor, providing that the drive is not operating in keypad mode.

# 3.9 Routine maintenance

The drive should be installed in a cool, clean, well ventilated location. Contact of moisture and dust with the drive should be prevented.

Regular checks of the following should be carried out to ensure drive / installation reliability are maximized:

Environment	
Ambient temperature	Ensure the enclosure temperature remains at or below maximum specified
Dust	Ensure the drive remains dust free – check that the heatsink and drive fan are not gathering dust. The lifetime of the fan is reduced in dusty environments.
Moisture	Ensure the drive enclosure shows no signs of condensation
Electrical	
Screw connections	Ensure all screw terminals remain tight
Crimp terminals	Ensure all crimp terminals remains tight – check for any discoloration which could indicate overheating
Cables	Check all cables for signs of damage

Safety Product Mechanical SMARTCARD Optimization Diagnostics information parameters information installation Installation parameters the motor operation PLC information

# 4 Electrical Installation

Many cable management features have been incorporated into the product, this chapter shows how to optimize them. Key features include:

- SAFE TORQUE OFF function
- · EMC compliance with shielding / grounding accessories
- · Product rating, fusing and cabling information
- · Brake resistor details (selection / ratings)

#### Electric shock risk

The voltages present in the following locations can cause severe electric shock and may be lethal:

- · AC supply cables and connections
- · DC and brake cables, and connections
- · Output cables and connections
- Many internal parts of the drive, and external option units Unless otherwise indicated, control terminals are single insulated and must not be touched.

#### Isolation device

The AC supply must be disconnected from the drive using an approved isolation device before any cover is removed from the drive or before any servicing work is performed.

#### STOP function

The STOP function does not remove dangerous voltages from the drive, the motor or any external option units.

#### SAFE TORQUE OFF function

The SAFE TORQUE OFF function does not remove dangerous voltages from the drive, the motor or any external option units.

## Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

Normally, the capacitors are discharged by an internal resistor. Under certain, unusual fault conditions, it is possible that the capacitors may fail to discharge, or be prevented from being discharged by a voltage applied to the output terminals. If the drive has failed in a manner that causes the display to go blank immediately, it is possible the capacitors will not be discharged. In this case, consult Control Techniques or their authorized distributor.

# Equipment supplied by plug and socket

Special attention must be given if the drive is installed in equipment which is connected to the AC supply by a plug and socket. The AC supply terminals of the drive are connected to the internal capacitors through rectifier diodes which are not intended to give safety isolation. If the plug terminals can be touched when the plug is disconnected from the socket, a means of automatically isolating the plug from the drive must be used (e.g. a latching relay).

### Permanent magnet motors

Permanent magnet motors generate electrical power if they are rotated, even when the supply to the drive is disconnected. If that happens then the drive will become energized through its motor terminals.

If the motor load is capable of rotating the motor when the supply is disconnected, then the motor must be isolated from the drive before gaining access to any live parts.

#### Fuses

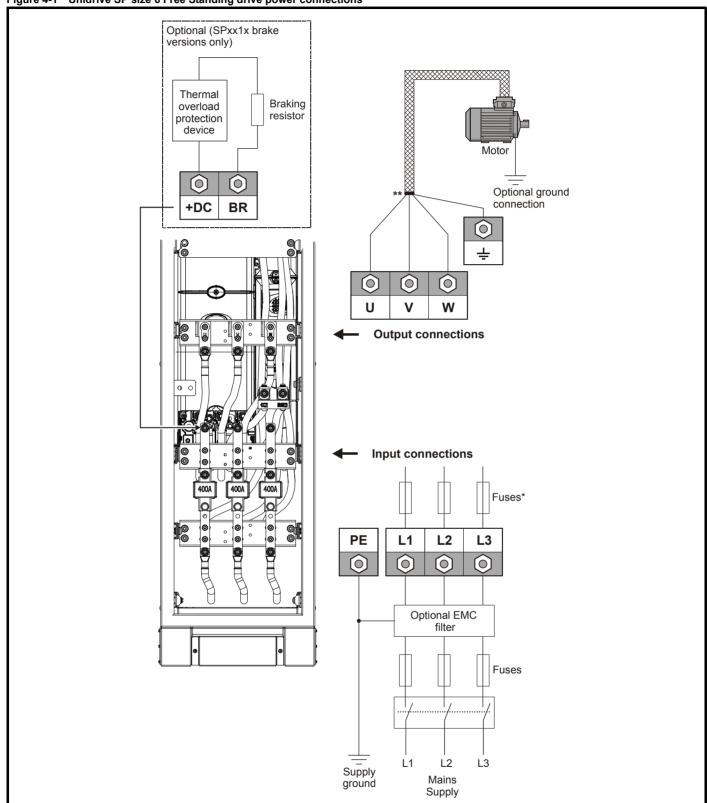

The AC supply to the drive must be installed with suitable protection against overload and short circuits. Table 4-3 and Table 4-4 on page 61 show the recommended fuse ratings. Failure to observe this requirement will increase the risk of fire

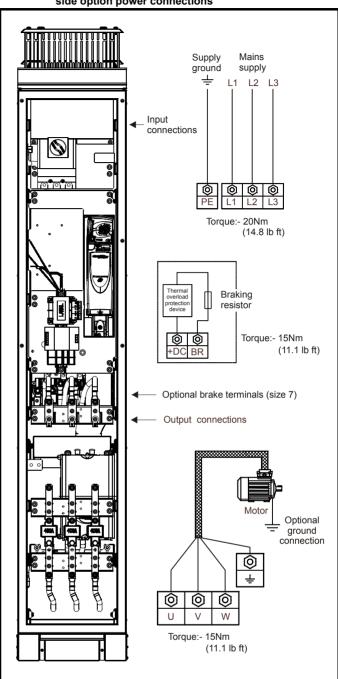

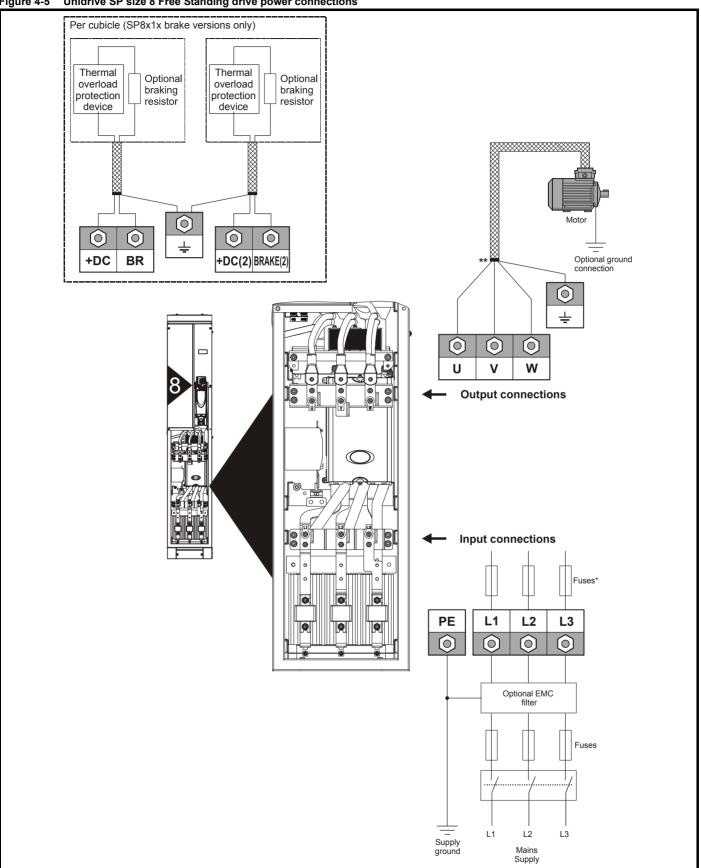

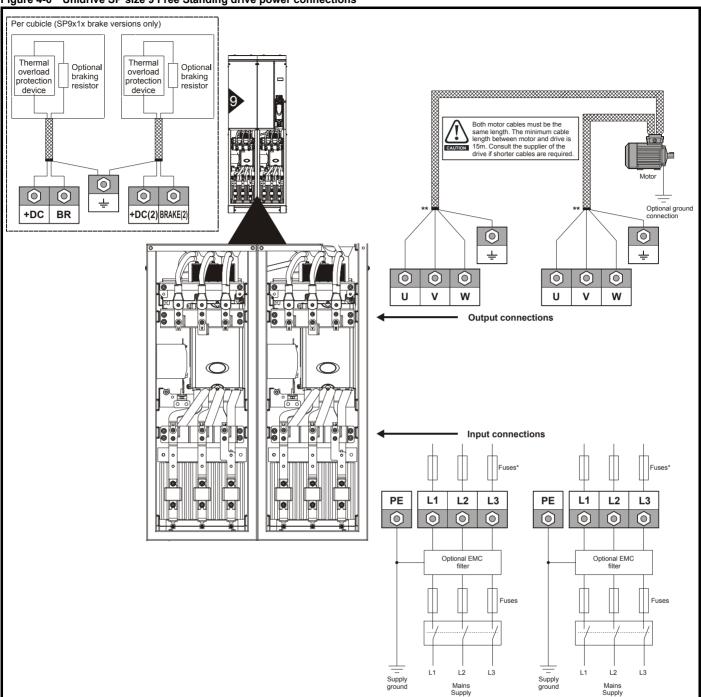

Figure 4-5 Unidrive SP size 8 Free Standing drive power connections

<sup>\*</sup> Free Standing drives are available fitted with or without fuses. If cubicles are supplied without fuses, the user must fit them during the installation. Fuses may be purchased from Control Techniques, see Figure 4-3 on page 61, Figure 4-4 on page 61 and Figure 4-5 on page 62 for more information.

<sup>\*\*</sup> Cable shield must be bonded to gland plate.

Figure 4-6 Unidrive SP size 9 Free Standing drive power connections

<sup>\*</sup> Free Standing drives are available fitted with or without fuses. If cubicles are supplied without fuses, the user must fit them during the installation. Fuses may be purchased from Control Techniques, see Figure 4-3 on page 61, Figure 4-4 on page 61 and Figure 4-5 on page 62 for more information.

<sup>\*\*</sup> Cable shield must be bonded to gland plate.

Safety Product information installation installation installation in the parameters of the motor of the motor information in the parameters of the motor of the m

#### 4.1.2 Ground connections

Electrochemical corrosion of earthing terminals
Ensure that grounding terminals are protected against corrosion i.e. as could be caused by condensation.

Figure 4-7 Unidrive SP size 6 and 7 Free Standing drive ground connections

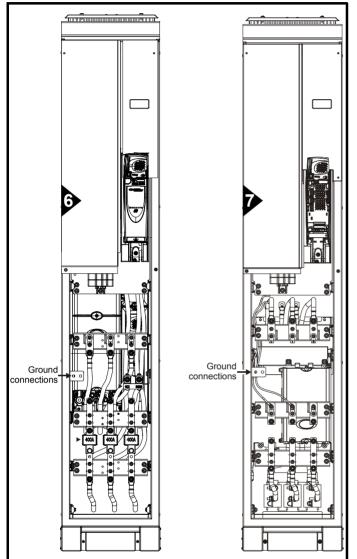

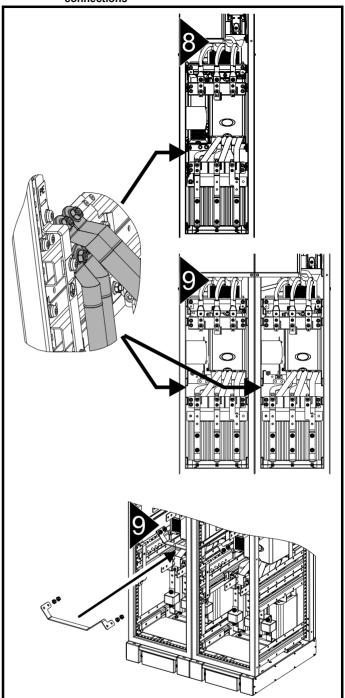

Figure 4-8 Unidrive SP size 8 and 9 Free Standing drive ground connections

The ground loop impedance must conform to the requirements of local safety regulations.

The drive must be grounded by a connection capable of carrying the prospective fault current until the protective device (fuse, etc). disconnects the AC supply.

The ground connections must be inspected and tested at appropriate intervals.

Safety Advanced **UL** Listing Optimization Diagnostics information information installation Installation parameters the motor operation PLC parameters data information

# 4.2 AC supply requirements

Voltage:

SPx4xx 380V to 480V ±10% SPx6xx 500V to 690V ±10%

Number of phases: 3

Maximum supply imbalance: 2% negative phase sequence (equivalent to 3% voltage imbalance between phases).

Frequency range: 48 to 65 Hz

For UL compliance only, the maximum supply symmetrical fault current must be limited to 100kA

#### 4.2.1 Supply types

Drives rated for supply voltage up to 575V are suitable for use with any supply type, i.e. TN-S, TN-C-S, TT, IT, with grounding at any potential, i.e. neutral, centre or corner ("grounded-delta").

Grounded delta supplies >575V are not permitted.

Drives are suitable for use on supplies of installation category III and lower, according to IEC60664-1. This means they may be connected permanently to the supply at its origin in a building, but for outdoor installation additional over-voltage suppression (transient voltage surge suppression) must be provided to reduce category IV to category III.

#### Operation with IT (ungrounded) supplies:

Special attention is required when using internal or external EMC filters with ungrounded supplies, because in the event of a ground (earth) fault in the motor circuit the drive may not trip and the filter could be over-stressed. In this case, either the filter must not be used (removed) or additional independent motor ground fault protection must be provided. Refer to Table 4-1.

For details of ground fault protection contact the supplier of the drive

A ground fault in the supply has no effect in any case. If the motor must continue to run with a ground fault in its own circuit then an input isolating transformer must be provided and if an EMC filter is required it must be located in the primary circuit.

Unusual hazards can occur on ungrounded supplies with more than one source, for example on ships. Contact the supplier of the drive for more information.

Table 4-1 Behavior of the drive in the event of a motor circuit ground (earth) fault with an IT supply

Drive size	Internal filter only	External filter (in addition to the internal filter)
	May not trip – precautions required	May not trip – precautions required
6 to 9	Remove the EMC filter     Use ground leakage relay	<ul><li>Do not use EMC filter</li><li>Use ground leakage relay</li></ul>

# 4.2.2 Supplies requiring line reactors

Input line reactors reduce the risk of damage to the drive resulting from poor phase balance or severe disturbances on the supply network.

Where line reactors are to be used, reactance values of approximately 2% are recommended. Higher values may be used if necessary, but may result in a loss of drive output (reduced torque at high speed) because of the voltage drop.

For all drive ratings, 2% line reactors permit drives to be used with a supply unbalance of up to 3.5% negative phase sequence (equivalent to 5% voltage imbalance between phases).

Severe disturbances may be caused by the following factors, for example:

Power factor correction equipment connected close to the drive.

- Large DC drives having no or inadequate line reactors connected to the supply.
- Direct-on-line started motor(s) connected to the supply such that when any of these motors are started, the voltage dip exceeds 20%.

Such disturbances may cause excessive peak currents to flow in the input power circuit of the drive. This may cause nuisance tripping, or in extreme cases, failure of the drive.

Drives of low power rating may also be susceptible to disturbance when connected to supplies with a high rated capacity.

All Free Standing drives have internal AC line chokes, so they do not require additional AC line reactors except for cases of excessive phase unbalance or extreme supply conditions.

When required, each drive must have its own reactor(s). Three individual reactors or a single three-phase reactor should be used.

#### Reactor current ratings

The current rating of the line reactors should be as follows:

Continuous current rating:

Not less than the continuous input current rating of the drive

Repetitive peak current rating:

Not less than twice the continuous input current rating of the drive

#### 4.2.3 Input inductor calculation.

To calculate the inductance required (at **Y**%), use the following equation:

$$L = \frac{Y}{100} \times \frac{V}{\sqrt{3}} \times \frac{1}{2\pi f I}$$

Where:

I = drive rated input current (A)

L = inductance (H)

f = supply frequency (Hz)

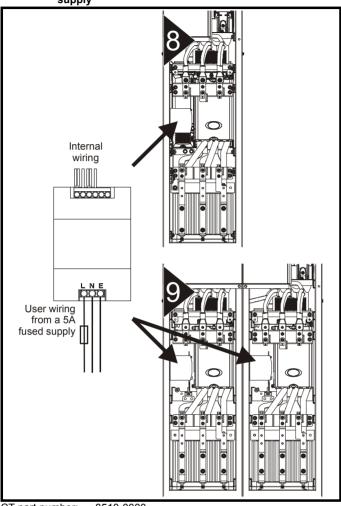

V = voltage between lines

Product information Safety Mechanical SMARTCARD **UL** Listing Optimization Diagnostics information Installation the motor PLC information installation parameters operation parameters data

# 4.3 Auxiliary power supply

Model sizes 8 and 9 with date code Q45 and earlier, require an auxiliary 230V power supply to each enclosure for the roof fan (mounted to SP8XX4 and SP9XX5) and to feed the internal 24V power supply. The 24V power supply is used to supply the rectifier control electronics and the heatsink fans on the power module.

Figure 4-9 Location of size 8 and 9 Free Standing drive 24V power supply

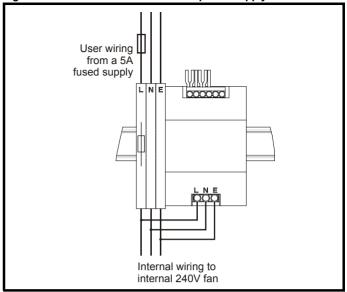

CT part number: 8510-0000 Current rating: 10A

Input voltage: 85 to 123 / 176 to 264Vac auto switching

Cable size: 0.5mm² (20AWG) Supply fuse: 5A slow-blow

For the SP8XX4 and SP9XX5 models, the design of the 24V power supply is different due to the additional fan on the Free Standing drive roof, as shown in Figure 4-10.

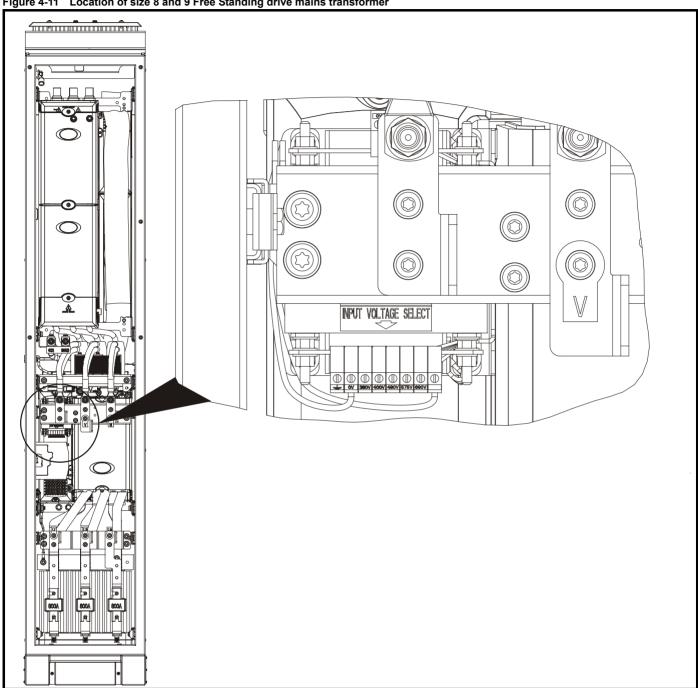

Figure 4-10 SP8XX4 and SP9XX5 24V power supply

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

For all size 6 & 7, and size 8 & 9 units that have a date code of R48 and later, a mains transformer has been introduced for Unidrive SP 8XXX and 9XXX Free Standing drives. The new transformer eliminates the requirement for a separate external 230V power source. A connection from the L1 and L2 input phases is transformed to 230V single phase to supply the AC to DC 24V power supply and directly supply the 230Vac roof fan in the SP84x4 and SP94x5 models.

Figure 4-11 Location of size 8 and 9 Free Standing drive mains transformer

The transformer has a number of selectable input voltages. As standard, the spur connection from the L1 phase is now parked in the lower right hand terminal during shipment. This parked terminal is not connected to any of the primary windings, therefore depending on variances in the 400V or 690V supply, this cable must be connected by the user to either the 380V, 400V, 480V, 575V or 690V connection.

Until the cable is moved from the parked position to the terminals identified above, the drive will not power up using the three phase supply.

The ground and 0V wires are also pre-fitted and must not be changed.

# 4.4 Control 24Vdc supply

The 24Vdc input on the Unidrive SP has three main functions.

- It can be used to supplement the drive's own internal 24V when multiple SM-Universal Encoder Plus, SM-Encoder Output Plus or SM-I/O Plus or SM-I/O32 modules are being used, and the current drawn by these modules is greater than the drive can supply. (If too much current is drawn from the drive, the drive will initiate a 'PS.24V' trip).
- It can be used as a back-up power supply to keep the control circuits of the drive powered up when the line power supply is removed. This allows any fieldbus modules, application modules, encoders or serial communications to continue to operate.
- It can be used to commission / start the drive when line power supply voltages are not available, as the display operates correctly. However, the drive will be in the UV trip state unless the line power supply is present, therefore diagnostics may not be possible. (Power down save parameters are not saved when using the 24V back-up power supply input).

The working voltage range of the 24V power supply is as follows:

Maximum continuous operating voltage: 30.0 V
Minimum continuous operating voltage: 19.2 V
Nominal operating voltage: 24.0 V
Minimum start up voltage: 21.6 V
Maximum power supply requirement at 24V: 60 W
Recommended fuse: 3 A, 50 Vdc

Minimum and maximum voltage values include ripple and noise. Ripple and noise values must not exceed 5%.

# 4.5 Ratings

The input current is affected by the supply voltage and impedance.

#### Typical input current

The values of typical input current are given to aid calculations for power flow and power loss.

The values of typical input current are stated for a balanced supply.

#### Maximum continuous input current

The values of maximum continuous input current are given to aid the selection of cables and fuses. These values are stated for the worst case condition with the unusual combination of stiff supply with bad balance. The value stated for the maximum continuous input current would only be seen in one of the input phases. The current in the other two phases would be significantly lower.

The values of maximum input current are stated for a supply with a 2% negative phase-sequence imbalance and rated at the supply fault current given in Table 4-2.

Table 4-2 Supply fault current used to calculate maximum input currents

Ferraz	400A	4300-0400
Ferraz	800A	4300-0800
Bussmann	400A	3533-4069
Bussmann	800A	3533-8069

Table 4-6 Installation class

Key to t	he cable installation method (ref: IEC60364-5-52:2001)
B1	Separate Cables in Conduit
B2	Multi-core cable in conduit
С	Multi-core cable in free-air
E	On perforated tray
F	Separate cables bunched in groups of three, in free air
G	Individual cables separated vertically in free air

#### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for cable installation method B2 (multicore cable in conduit).

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

#### NOTE

Cable sizes indicated are PVC insulated.

#### NOTE

The recommended output cable sizes assume that the motor maximum current matches that of the drive. Where a motor of reduced rating is used the cable rating may be chosen to match that of the motor. To ensure that the motor and cable are protected against overload, the drive must be programmed with the correct motor rated current.

#### NOTE

UL listing is dependent on the use of the correct type of UL-listed fuse, and applies when symmetrical short-circuit current does not exceed 100kA. See Chapter 14 *UL Listing information* on page 272 for sizing information.

A fuse or other protection must be included in all live connections to the AC supply.

See Chapter 14 *UL Listing information* on page 272 for UL listing requirements.

#### Fuse types

The fuse voltage rating must be suitable for the drive supply voltage.

#### **Ground connections**

The drive must be connected to the system ground of the AC supply. The ground wiring must conform to local regulations and codes of practice.

#### 4.5.1 Main AC supply contactor

The recommended AC supply contactor type is AC1.

# 4.6 Output circuit and motor protection

The output circuit has fast-acting electronic short-circuit protection which limits the fault current to typically no more than five times the rated output current, and interrupts the current in approximately 20µs. No additional short-circuit protection devices are required.

The drive provides overload protection for the motor and its cable. For this to be effective, Pr **0.46** *Motor rated current* must be set to suit the motor.

Pr **0.46** *Motor rated current* must be set correctly to avoid a risk of fire in the event of motor overload.

There is also provision for the use of a motor thermistor to prevent overheating of the motor, e.g. due to loss of cooling.

#### 4.6.1 Cable types and lengths

Since capacitance in the motor cable causes loading on the output of the drive, ensure the cable length does not exceed the values given in Table 4-7.

Use 105°C (221°F) (UL 60/75°C temp rise) PVC-insulated cable with copper conductors having a suitable voltage rating, for the following power connections:

- · AC supply to external EMC filter (when used)
- AC supply (or external EMC filter) to drive
- · Drive to motor
- · Drive to braking resistor

Table 4-7 Maximum motor cable lengths

Model	Maximum Permissible motor cable length						
wodei	3 kHz	4 kHz	6 kHz				
SP64X1							
SP64X2	250m	185m	125m				
SP74X1	(820 ft)	(607 ft)	(410 ft)

SP96X5							

- Cable lengths in excess of the specified values may be used only when special techniques are adopted; refer to the supplier of the drive
- The default switching frequency is 3kHz for open-loop and closed-loop vector and 6kHz for servo.

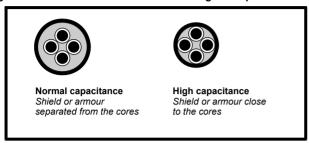

Safety Product information Information Mechanical information Installation Mechanical information Installation Mechanical information Mechanical information Installation Mechanical Installation Mech

#### High-capacitance cables

The maximum cable length is reduced from that shown in Table 4-7, if high capacitance motor cables are used.

Most cables have an insulating jacket between the cores and the armor or shield; these cables have a low capacitance and are recommended. Cables that do not have an insulating jacket tend to have high capacitance; if a cable of this type is used, the maximum cable length is half that quoted in the tables. (Figure 4-12 shows how to identify the two types).

Figure 4-12 Cable construction influencing the capacitance

The cable used for Table 4-7 is shielded and contains four cores. Typical capacitance for this type of cable is 130pF/m (i.e. from one core to all others and the shield connected together).

#### 4.6.2 Motor winding voltage

The PWM output voltage can adversely affect the inter-turn insulation in the motor. This is because of the high rate of change of voltage, in conjunction with the impedance of the motor cable and the distributed nature of the motor winding.

For normal operation with AC supplies up to 500Vac and a standard motor with a good quality insulation system, there is no need for any special precautions. In case of doubt the motor supplier should be consulted.

Special precautions are recommended under the following conditions, but only if the motor cable length exceeds 10m:

- · AC supply voltage exceeds 500V
- Operation of 400V drive with continuous or very frequent sustained braking
- Multiple motors connected to a single drive

For multiple motors, the precautions given in section 4.6.3 *Multiple motors* should be followed.

For the other cases listed, it is recommended that an inverter-rated motor be used. This has a reinforced insulation system intended by the manufacturer for repetitive fast-rising pulsed voltage operation.

Users of 575V NEMA rated motors should note that the specification for inverter-rated motors given in NEMA MG1 section 31 is sufficient for motoring operation but not where the motor spends significant periods braking. In that case an insulation peak voltage rating of 2.2kV is recommended.

If it is not practical to use an inverter-rated motor, an output choke (inductor) should be used. The recommended type is a simple iron-cored component with a reactance of about 2%. The exact value is not critical. This operates in conjunction with the capacitance of the motor cable to increase the rise-time of the motor terminal voltage and prevent excessive electrical stress.

#### 4.6.3 Multiple motors

#### Open-loop only

If the drive is to control more than one motor, one of the fixed V/F modes should be selected (Pr **5.14** = Fd or SrE). Make the motor connections as shown in Figure 4-13 and Figure 4-14. The maximum cable lengths in Table 4-7 apply to the sum of the total cable lengths from the drive to each motor.

It is recommended that each motor is connected through a protection relay since the drive cannot protect each motor individually. For  $\boldsymbol{\lambda}$  connection, a sinusoidal filter or an output inductor must be connected as shown in Figure 4-14, even when the cable lengths are less than the maximum permissible. For details of inductor sizes refer to the supplier of the drive.

Figure 4-13 Preferred chain connection for multiple motors

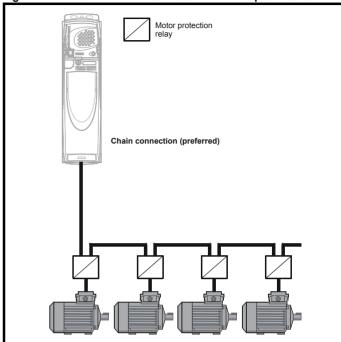

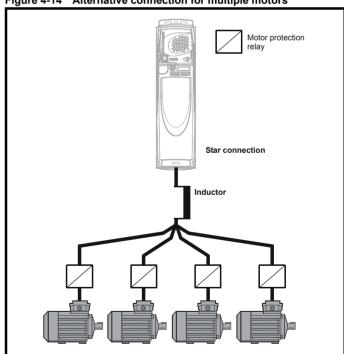

Figure 4-14 Alternative connection for multiple motors

Safety Mechanica SMARTCARD **UL** Listing Optimization Diagnostics information information installation Installation started parameters the motor operation PLC parameters information

### 4.6.4 $\downarrow$ / $\triangle$ motor operation

The default setting of the motor rated voltage parameter is the same as the drive rated voltage, i.e.

400V drive 400V rated voltage 690V drive 690V rated voltage

A typical 3 phase motor would be connected in  $\Lambda$  for 400V operation or  $\Delta$  for 200V operation, however, variations on this are common e.g.

人 690V A 400V

Incorrect connection of the windings will cause severe under or over fluxing of the motor, leading to a very poor output torque or motor saturation and overheating respectively.

### 4.6.5 Output contactor

If the cable between the drive and the motor is to be interrupted by a contactor or circuit breaker, ensure that the drive is disabled before the contactor or circuit breaker is opened or closed. Severe arcing may occur if this circuit is interrupted with the motor running at high current and low speed.

A contactor is sometimes required to be installed between the drive and motor for safety purposes.

The recommended motor contactor is the AC3 type.

Switching of an output contactor should only occur when the output of the drive is disabled.

Opening or closing of the contactor with the drive enabled will lead to:

- 1. OI.AC trips (which cannot be reset for 10 seconds)
- 2. High levels of radio frequency noise emission
- 3. Increased contactor wear and tear

The Drive Enable terminal (T31) when opened provides a function. This can in many cases replace output contactors.

For further information see section 4.13 Safe torque off on page 77.

# 4.7 Braking

Braking occurs when the drive is decelerating the motor, or is preventing the motor from gaining speed due to mechanical influences. During braking, energy is returned to the drive from the motor.

When the motor is being braked by the drive, the maximum regenerated power that the drive can absorb is equal to the power dissipation (losses) of the drive.

When the regenerated power is likely to exceed these losses, the DC bus voltage of the drive increases. Under default conditions, the drive brakes the motor under PI control, which extends the deceleration time as necessary in order to prevent the DC bus voltage from rising above a user defined set-point.

If the drive is expected to rapidly decelerate a load, or to hold back an overhauling load, a braking resistor must be installed.

Table 4-8 shows the DC voltage level at which the drive turns on the braking transistor.

Table 4-8 Braking transistor turn on voltage

Drive voltage rating	DC bus voltage level
400V	780V
690V	1120V

#### NOTE

When a braking resistor is used, Pr **0.15** should be set to FASt ramp mode.

#### **High temperatures**

Braking resistors can reach high temperatures. Locate braking resistors so that damage cannot result. Use cable having insulation capable of withstanding high temperatures.

### 4.7.1 Braking resistor

#### Overload protection

When a braking resistor is used, it is essential that an overload protection device is incorporated in the braking resistor circuit; this is described in Figure 4-15 on page 65.

Ensure that the braking resistor is mounted in a ventilated metal housing that will perform the following functions:

- · Prevent inadvertent contact with the resistor
- Allow adequate ventilation for the resistor

When compliance with EMC emission standards is required, external connection requires the cable to be armored or shielded, since it is not fully contained in a metal enclosure.

Internal connection does not require the cable to be armored or shielded.

#### Minimum resistances and power ratings

Table 4-9 Minimum resistance values and peak power rating for the braking resistor at 40°C (104°F)

Model	Minimum resistance*Ω	Instantaneous Power Rating (kW)	Average Power for 60s (kW)

<sup>\*</sup> Resistor tolerance: ±10%

#### NOTE

Connections from the brake resistor should be kept separate. The resistor tolerance should not be more than  $\pm$  10 % and the resistor should be matched to within  $\pm$  5%.

On SP Size 8 12 pulse drives the DC bus connections are commoned between the SPMD modules, hence one braking resistor can be used when braking power required is low.

On SP Size 9, 12 pulse drives the DC bus connections are commoned between the SPMD modules in each enclosure, but this is not connected between the enclosures, hence two bake resistors (one resistor with each enclosure) can be used when the required braking power is low.

For high-inertia loads or under continuous braking, the *continuous power* dissipated in the braking resistor may be as high as the power rating of the drive. The total *energy* dissipated in the braking resistor is dependent on the amount of energy to be extracted from the load.

The instantaneous power rating refers to the short-term maximum power dissipated during the *on* intervals of the pulse width modulated braking control cycle. The braking resistor must be able to withstand this dissipation for short intervals (milliseconds). Higher resistance values require proportionately lower instantaneous power ratings.

In most applications, braking occurs only occasionally. This allows the continuous power rating of the braking resistor to be much lower than the power rating of the drive. It is essential, though, that the instantaneous power rating and energy rating of the braking resistor are sufficient for the most extreme braking duty that is likely to be encountered.

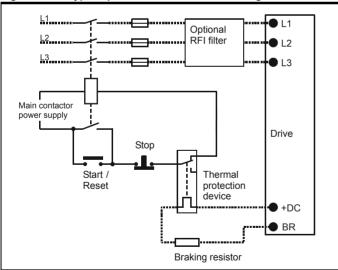

Optimization of the braking resistor requires a careful consideration of the braking duty.

Select a value of resistance for the braking resistor that is not less than the specified minimum resistance. Larger resistance values may give a cost saving, as well as a safety benefit in the event of a fault in the braking system. Braking capability will then be reduced, which could cause the drive to trip during braking if the value chosen is too large.

#### Thermal protection circuit for the braking resistor

The thermal protection circuit must disconnect the AC supply from the drive if the resistor becomes overloaded due to a fault. Figure 4-15 shows a typical circuit arrangement.

Figure 4-15 Typical protection circuit for a braking resistor

#### 4.7.2 Braking resistor software overload protection

The Unidrive SP software contains an overload protection function for a braking resistor. In order to enable and set-up this function, it is necessary to enter two values into the drive:

- Resistor short-time overload time (Pr 10.30)
- Resistor minimum time between repeated short-time overloads (Pr 10.31)

This data should be obtained from the manufacturer of the braking resistors

Pr 10.39 gives an indication of braking resistor temperature based on a simple thermal model. Zero indicates the resistor is close to ambient and 100% is the maximum temperature the resistor can withstand. An OVLd alarm is given if this parameter is above 75% and the braking IGBT is active. An It.br trip will occur if Pr 10.39 reaches 100%, when Pr 10.37 is set to 0 (default value) or 1.

If Pr 10.37 is equal to 2 or 3 an It.br trip will not occur when Pr 10.39 reaches 100%, but instead the braking IGBT will be disabled until Pr 10.39 falls below 95%. This option is intended for applications with parallel connected DC buses where there are several braking resistors, each of which cannot withstand full DC bus voltage continuously. With this type of application it is unlikely the braking energy will be shared equally between the resistors because of voltage measurement tolerances within the individual drives.

Therefore with Pr **10.37** set to 2 or 3, then as soon as a resistor has reached its maximum temperature the drive will disable the braking IGBT, and another resistor on another drive will take up the braking energy. Once Pr **10.39** has fallen below 95% the drive will allow the braking IGBT to operate again.

See the *Unidrive SP Advanced User Guide* for more information on Pr **10.30**, Pr **10.31**, Pr **10.37** and Pr **10.39**.

This software overload protection should be used in addition to an external overload protection device.

Safety Optimization Diagnostics information information installation Installation started parameters the moto operation PLC parameters information

#### 4.8 Ground leakage

The ground leakage current is dependant on whether the internal EMC filter is fitted or not. The drive is supplied with the filter installed. Instructions for removing the internal filter are given in Figure 4-xx on page xx.

#### With internal filter installed:

Size 6 and 7: 56mA\* AC at 400V 50Hz

18μA DC with a 600V DC bus (33M $\Omega$ )

Size 8: 112mA\* AC at 400V 50Hz

36µA DC with a 600V DC bus

Size 9: 224mA\* AC at 400V 50Hz (SP9xx0: 168mA\* AC at

400V 50Hz)

72μA DC with a 600V DC bus (SP9xx0: 54 μA DC with a

600V DC bus)

With internal filter removed: <1mA

In both cases there is an internal voltage surge protection device connected to ground. Under normal circumstances this carries negligible current.

#### 4.9 **EMC** (Electromagnetic compatibility)

The requirements for EMC are divided into three levels in the following three sections:

- 1. General requirements on page 67 for all applications. To ensure reliable operation of the drive and minimize the risk of disturbing nearby equipment. The immunity standards specified in Surge immunity of control circuits - long cables and connections outside a building on page page 69 will be met, but not to any specific emission standards. Note also the special requirements described for increased surge immunity of control circuits where control wiring is extended.
- Requirements for meeting the EMC standard for power drive systems on page 68.
- Requirements for meeting the generic emission standards for the industrial environment on page 68.

The recommendations in section 4.9.4 General requirements for EMC will usually be sufficient to avoid causing disturbance to adjacent equipment of industrial quality. If particularly sensitive equipment is to be used nearby, or in a non-industrial environment, then the recommendations of section 4.9.5 Compliance with EN 61800-3:2004 (standard for Power Drive Systems) or section 4.9.6 Compliance with generic emission standards should be followed to give reduced radio-frequency emission

In order to ensure the installation meets the various emission standards described in:

- The Declaration of Conformity at the front of this manual.
- See section 12 Technical data on page 243.

The correct external EMC filter must be used, and all of the guidelines in section section 4.9.4 General requirements for EMC and section 4.9.6 Compliance with generic emission standards must be followed.

#### High ground leakage current

When an EMC filter is used, a permanent fixed ground connection must be provided which does not pass through a connector or flexible power cord. This includes the internal WARNING EMC filter.

#### NOTE

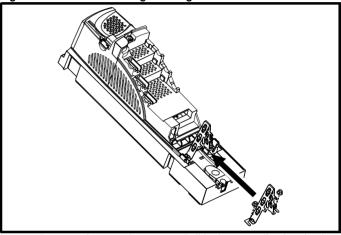

The installer of the drive is responsible for ensuring compliance with the EMC regulations that apply where the drive is to be used.

#### **Grounding hardware**

The drive is supplied with a grounding clamp and a grounding bracket to facilitate EMC compliance. They provide a convenient method for direct grounding of cable shields without the use of "pig-tails". Cable shields can be bared and clamped to the grounding bracket, using metal clips or clamps<sup>1</sup> (not supplied) or cable ties. Note that the shield must in all cases be continued through the clamp to the intended terminal on the drive, in accordance with the connection details for the specific signal.

<sup>1</sup>A suitable clamp is the Phoenix DIN rail mounted SK14 cable clamp (for cables with a maximum outer diameter of 14mm). Figure 4-14 shows details for the installation of the grounding bracket.

Figure 4-16 Installation of grounding bracket

Loosen the ground connection nuts and slide the grounding bracket in the direction shown. Once in place, re-tighten the ground connection

A faston tab is located on the grounding bracket for the purpose of connecting the drive 0V to ground should the user require to do so.

#### NOTE

The 0V of the drive is internally connected to ground.

#### Internal EMC filter

It is recommended that the internal EMC filter be kept in place unless there is a specific reason for removing it.

When the drive is used with ungrounded (IT) supplies the internal EMC filter must be removed unless additional motor ground fault protection is installed.

Instructions regarding the disconnection of the EMC filter can be found in Figure 4-17 and Figure 4-18 on page 67. For details of ground fault protection contact the supplier of the drive

The internal EMC filter reduces radio-frequency emission into the line power supply. Where the motor cable is short, it permits the requirements of EN61800-3 to be met for the second environment - see section 4.9.5 Compliance with EN 61800-3:2004 (standard for Power Drive Systems) on page 68 and section 12.1.23 Electromagnetic compatibility (EMC) on page 250.

For longer motor cables the filter continues to provide a useful reduction in emission level, and when used with any length of shielded motor cable up to the limit for the drive, it is unlikely that nearby industrial equipment will be disturbed. It is recommended that the filter be used in all applications unless the ground leakage current is unacceptable or the above conditions are true

<sup>\*</sup> Proportional to the supply voltage and frequency.

Safety Product information installation installation installation in the control of the control

#### 4.9.3 Disconnection of the internal EMC filter

Free Standing drives that are manufactured with date codes U18 and later, allow the internal EMC filter to be disconnected without the need for physical removal from the SPMD/A modules.

- Loosen the retaining screw 1 (M8 x 20) and 2 (M4 x 10) as indicated in Figure 4-17.
- Rotate the linking strip upwards around the M8 x 20 screw so that it is clear of the original connection point as shown in Figure 4-18.
- 3. Re-secure the M8 x 20 screw (1) to 12 Nm.
- 4. Re-secure the M4 x 10 screw (2) to prevent it coming loose.

Figure 4-17 Loosen the EMC filter mounting screws

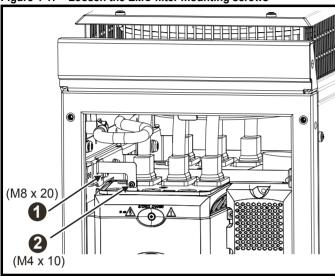

Figure 4-18 Repositioning the EMC filter link

# 4.9.4 General requirements for EMC

#### Ground (earth) connections

If ground connections are made using a separate cable, they should run parallel to the appropriate power cable to minimize emissions.

The incoming supply ground should be connected to the earth/ground terminal inside the enclosure.

Use four core cable to connect the motor to the drive. The ground conductor in the motor cable must be connected directly to the earth/ ground terminal of the drive and motor. It must not be connected directly to the power earth/ground busbar.

#### Cable layout

Do not place sensitive (unscreened) signal circuits in a zone extending 300mm (12in) all around the drive, motor cable, input cable from EMC filter and unscreened braking resistor cable (if used).

#### NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the motor cable, to avoid this noise current spreading through the control system.

#### Feedback device cable shielding

Shielding considerations are important for PWM drive installations due to the high voltages and currents present in the output (motor) circuit with a very wide frequency spectrum, typically from 0 to 20MHz.

The following guidance is divided into two parts:

- 1. Ensuring correct transfer of data without disturbance from electrical noise originating either within the drive or from external sources.
- Additional measures to prevent unwanted emission of radio frequency noise. These are optional and only required where the installation is subject to specific requirements for radio frequency emission control.

# To ensure correct transfer of data, observe the following:

#### **Resolver connections:**

- Use a cable with an overall shield and twisted pairs for the resolver signals.
- Connect the cable shield to the drive 0V connection by the shortest possible link ("pigtail").
- It is generally preferable not to connect the cable shield to the
  resolver. However in cases where there is an exceptional level of
  common-mode noise voltage present on the resolver body, it may be
  helpful to connect the shield there. If this is done then it becomes
  essential to ensure the absolute minimum length of "pigtails" at both
  shield connections, and possibly to clamp the cable shield directly to
  the resolver body and to the drive grounding bracket.
- The cable should preferably not be interrupted. If interruptions are unavoidable, ensure the absolute minimum length of "pigtail" in the shield connections at each interruption.

#### **Encoder connections:**

- Use a cable with the correct impedance.
- Use a cable with individually shielded twisted pairs.
- Connect the cable shields to 0V at both the drive and the encoder, using the shortest possible links ("pigtails").
- The cable should preferably not be interrupted. If interruptions are unavoidable, ensure the absolute minimum length of "pigtail" in the shield connections at each interruption. Preferably, use a connection method which provides substantial metallic clamps for the cable shield terminations.

The above applies where the encoder body is isolated from the motor and where the encoder circuit is isolated from the encoder body. Where there is no isolation between the encoder circuits and the motor body, and in case of doubt, the following additional requirement must be observed to provide the best possible noise immunity.

 The shields must be directly clamped to the encoder body (no pigtail) and to the drive grounding bracket. This may be achieved by clamping of the individual shields or by providing an additional overall shield which is clamped.

#### NOTE

The recommendations of the encoder manufacturer must also be adhered to for the encoder connections.

#### NOTE

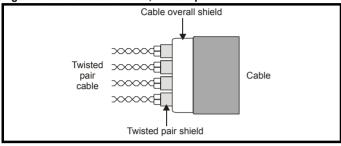

In order to guarantee maximum noise immunity for any application double shielded cable as shown should be used.

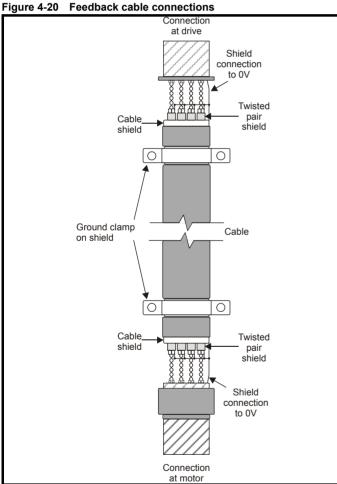

Safety Product information information Mechanical installation Mechanical Inst

In some cases single shielding of each pair of differential signals cables, or a single overall shield with individual shield on the thermistor connections is sufficient. In these cases all the shields should be connected to ground and 0V at both ends.

Figure 4-19 and Figure 4-20 illustrate the preferred construction of cable and the method of clamping. The outer sheath of the cable should be stripped back enough to allow the clamp to be installed. The shield must not be broken or opened at this point. The clamps should be installed close to the drive or feedback device, with the ground connections made to a ground plate or similar metallic ground surface.

Figure 4-19 Feedback cable, twisted pair

To ensure suppression of radio frequency emission, observe the following:

- · Use a cable with an overall shield.
- Clamp the overall shield to grounded metallic surfaces at both the encoder and the drive, as illustrated in Figure 4-20 above.

# 4.9.5 Compliance with EN 61800-3:2004 (standard for Power Drive Systems)

Meeting the requirements of this standard depends on the environment that the drive is intended to operate in, as follows:

#### Operation in the first environment

Observe the guidelines given in section 4.9.6 *Compliance with generic emission standards*. An external EMC filter will always be required.

This is a product of the restricted distribution class according to IEC 61800-3.

In a residential environment this product may cause radio interference in which case the user may be required to take adequate counter measures.

#### Operation in the second environment

In all cases a shielded motor cable must be used. The drive contains an in-built filter for basic emission control. The requirements of operating in the second environment are met, depending on the motor cable length for 3kHz switching frequency as stated in Table 4-7 on page 62.

The table below summarizes the performance of in-built filters when used with size 6 and 7 drives.

Table 4-10 Second environment emission compliance

Drive size	Filter	Voltage	Motor cable length 0 - 100(m)
6	In-built	Any	Unrestricted
7	III-built	Ally	omesticied

### Key:

Unrestricted: EN 61800-3 second environment, unrestricted distribution

For longer motor cables, an external filter is required. Where a filter is required, follow the guidelines in section 4.9.6 below.

Where a filter is not required, follow the guidelines given in section 4.9.3 General requirements for EMC on page xx.

The second environment typically includes an industrial low voltage power supply network which does not supply buildings used for residential purposes. Operating the drive in this environment without an external EMC filter may cause interference to nearby electronic equipment whose sensitivity has not been considered. The user must take remedial measures if this situation arises. If the consequences of unexpected disturbance are severe, it is recommended that the guidelines in section 4.9.6 Compliance with generic emission standards be adhered to.

Refer to section 4.9 *EMC* (*Electromagnetic compatibility*) on page 66 for further information on compliance with EMC standards and definitions of environments.

#### 4.9.6 Compliance with generic emission standards

Use the recommended filter and shielded motor cable. Ensure the AC supply and ground cables are at least 100mm from the drive and motor cable.

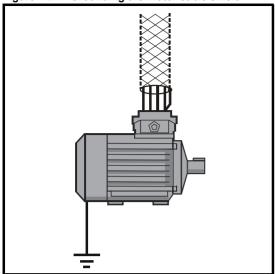

Avoid placing sensitive signal circuits in a zone 300mm (12in) all around the drive.

Ensure good EMC grounding.

Connect the shield of the motor cable to the ground terminal of the motor frame using a link that is as short as possible and not exceeding 50mm (2in) long. A full 360° termination of the shield to the terminal housing of the motor is beneficial.

It is unimportant for EMC purposes whether the motor cable contains an internal (safety) ground core, or there is a separate external ground conductor, or grounding is through the shield alone. An internal ground core will carry a high noise current and therefore it must be terminated as close as possible to the shield termination.

Figure 4-21 Grounding the motor cable shield

Wiring to the optional braking resistor(s) must be shielded

If the control wiring is to leave the enclosure, it must be shielded and the shield(s) clamped to the drive using the grounding bracket as shown in Figure 4-21 above. Remove the outer insulating cover of the cable to ensure the shield(s) make contact with the bracket, making sure to keep the shield(s) intact and as close to the terminals as possible.

Alternatively, wiring may be passed through a ferrite ring, part no. 3225-1004.

Figure 4-22 Grounding of signal cable shields using the grounding bracket

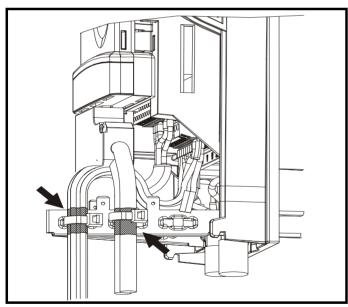

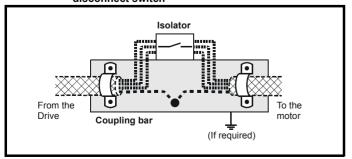

Figure 4-23 Connecting the motor cable to an isolator / disconnect switch

# Surge immunity of control circuits - long cables and connections outside a building

The input/output ports for the control circuits are designed for general use within machines and small systems without any special precautions.

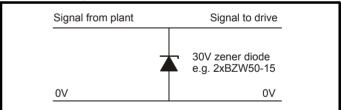

These circuits meet the requirements of EN61000-6-2:2005 (1kV surge) provided the 0V connection is not grounded. In applications where they may be exposed to high-energy voltage surges, some special measures may be required to prevent malfunction or damage. Surges may be caused by lightning or severe power faults in association with grounding arrangements which permit high transient voltages between nominally grounded points. This is a particular risk where the circuits extend outside the protection of a building.

As a general rule, if the circuits are to pass outside the building where the drive is located, or if cable runs within a building exceed 30m (98.5 ft), some additional precautions are advisable. One of the following techniques should be used:

- Galvanic isolation, i.e. do not connect the control 0V terminal to ground. Avoid loops in the control wiring, i.e. ensure every control wire is accompanied by its return (0V) wire.
- 2. Shielded cable with additional power ground bonding. The cable shield may be connected to ground at both ends, but in addition the ground conductors at both ends of the cable must be bonded together by a power ground cable (equipotential bonding cable) with cross-sectional area of at least 10mm2, or 10 times the area of the signal cable shield, or to suit the electrical safety requirements of the plant. This ensures that fault or surge current passes mainly through the ground cable and not in the signal cable shield. If the building or plant has a well-designed common bonded network this precaution is not necessary.
- Additional over-voltage suppression for the analog and digital inputs and outputs, a Zener diode network or a commercially available surge suppressor may be connected in parallel with the input circuit as shown in Figure 4-24 and Figure 4-25. If a digital port experiences a severe surge its protective trip may operate.

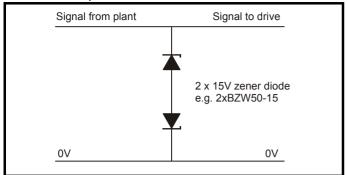

(O.Ld1 trip code 26). For continued operation after such an event, the trip can be reset automatically by setting Pr **10.34** to a value of 5.

Figure 4-24 Surge suppression for digital and unipolar inputs and outputs

Optimization Diagnostics information information installation Installation started parameters the motor operation PLC parameters data information

Figure 4-25 Surge suppression for analog and bipolar inputs and outputs

Surge suppression devices are available as rail-mounting modules, e.g. from Phoenix Contact:

Unipolar TT-UKK5-D/24 DC

Bipolar TT-UKK5-D/24 AC

These devices are not suitable for encoder signals or fast digital data networks because the capacitance of the diodes adversely affects the signal. Most encoders have galvanic isolation of the signal circuit from the motor frame, in which case no precautions are required. For data networks, follow the specific recommendations for the particular network.

#### 4.10 Serial communications connections

The Unidrive SP has a serial communications port (serial port) as standard supporting 2 wire EIA485 communications. Please see Table 4-11 for the connection details for the RJ45 connector.

Figure 4-26 Location of the RJ45 serial comms connector

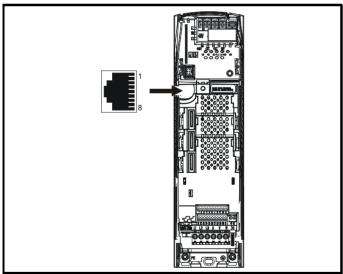

Table 4-11 Connection details for RJ45 connector

Pin	Function
1	120Ω Termination resistor
2	RX TX
3	Isolated 0V
4	+24V (100mA)
5	Isolated 0V
6	TX enable
7	RX\ TX\
8	RX\ TX\ (if termination resistors are required, link to pin 1)
Shell	Isolated 0V

The communications port applies a 2 unit load to the communications

Minimum number of connections are 2, 3, 7 and shield. Shielded cable must be used at all times.

#### 4.10.1 Isolation of the serial communications port

The serial communications port of the Unidrive SP is double insulated and meets the requirements for SELV in EN50178.

In order to meet the requirements for SELV in IEC60950 (IT equipment) it is necessary for the control computer to be grounded. Alternatively, when a lap-top or similar device is used which has no provision for grounding, an isolation WARNING device must be incorporated in the communications lead.

An isolated serial communications lead has been designed to connect the Unidrive SP to IT equipment (such as lap-top computers), and is available from the supplier of the drive. See below for details:

Table 4-12 Isolated serial comms lead details

Part number	Description
4500-0087	CT EIA232 Comms cable
4500-0096	CT USB Comms cable

The "isolated serial communications" lead has reinforced insulation as defined in IEC60950 for altitudes up to 3,000m.

When using the CT EIA232 Comms cable the available baud rate is limited to 19.2k baud.

#### Multi-drop network

The Unidrive SP can be used on a 2 wire EIA485 multi-drop network using the drive's serial communications port when the following quidelines are adhered to.

#### Connections

The network should be a daisy chain arrangement and not a A, although short stubs to the drive are allowed.

The minimum connections are pins 2 (RX TX), 3 (isolated 0V), 7 (RX\ TX\) and the shield.

Pin 4 (+24V) on each drive can be connected together but there is no power sharing mechanism between drives and therefore the maximum power available is the same as a single drive. (If pin 4 is not linked to the other drives on the network and has an individual load then the maximum power can be taken from pin 4 of each drive).

#### **Termination resistors**

If a drive is on the end of the network chain then pins 1 and 8 should be linked together. This will connect an internal  $120\Omega$  termination resistor between RXTX and RX\TX\. (If the end unit is not a drive or the user wishes to use their own termination resistor, a  $120\Omega$  termination resistor should be connected between RXTX and RX\TX\ at the end unit).

If the host is connected to a single drive then termination resistors should not be used unless the baud rate is high.

#### **CT Comms Cable**

The CT Comms Cable can be used on a multi-drop network but should only be used occasionally for diagnostic and set up purposes. The network must also be made up entirely of Unidrive SPs.

If the CT Comms Cable is to be used, then pin 6 (TX enable) should be connected on all drives and pin 4 (+24V) should be linked to at least 1 drive to supply power to the converter in the cable.

Only one CT Comms Cable can be used on a network.

## 4.11 Control connections

#### 4.11.1 General

Table 4-13 The Unidrive SP control connections consist of:

Function	Qty	Control parameters available	Terminal number
Differential analog input	1	Destination, offset, offset trim, invert, scaling	5,6
Single ended analog input	2	Mode, offset, scaling, invert, destination	7,8
Analog output	2	Source, mode, scaling,	9,10
Digital input	3	Destination, invert, logic select	27,28,29
Digital input / output	3	Input / output mode select, destination / source, invert, logic select	24,25,26
Relay	1	Source, invert	41,42
Drive enable (SAFE TORQUE OFF)	1		31
+10V User output	1		4
+24V User output	1	Source, invert	22
0V common	6		1, 3, 11, 21, 23, 30
+24V External input	1		2

Key:

**Destination** indicates the parameter which is being controlled by the

parameter: terminal / function

**Source** parameter: indicates the parameter being output by the terminal

 $\label{eq:mode} \textbf{Mode} \qquad \qquad \text{analog - indicates the mode of operation of the terminal},$ 

parameter: i.e. voltage 0-10V, current 4-20mA etc.

digital - indicates the mode of operation of the terminal, i.e. positive / negative logic (the Drive Enable terminal is fixed in positive logic), open collector.

All analog terminal functions can be programmed in menu 7.

All digital terminal functions (including the relay) can be programmed in menu 8

The setting of Pr **1.14** and Pr **6.04** can cause the function of digital inputs T25 to T29 to change. For more information, please refer to section 11.21.1 *Reference modes* on page 234 and section 11.21.7 *Start / stop logic modes* on page 240.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs or outputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

Ensure the logic sense is correct for the control circuit to be used. Incorrect logic sense could cause the motor to be started unexpectedly.

Positive logic is the default state for Unidrive SP.

#### NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

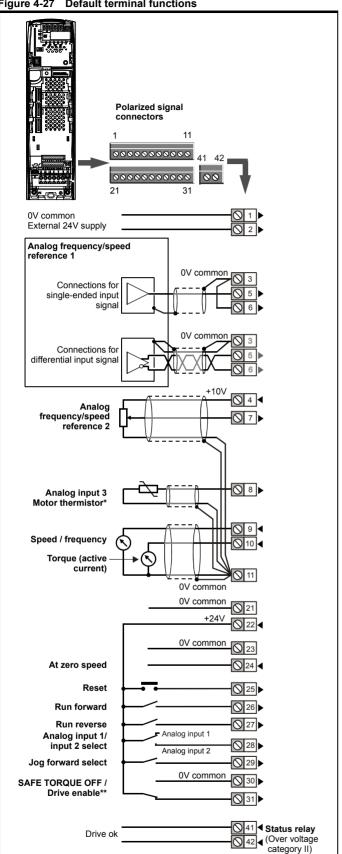

#### NOTE

The SAFE TORQUE OFF / drive enable terminal is a positive logic input only. It is not affected by the setting of Pr **8.29** Positive logic select.

#### NOTE

The common 0V from analog signals should, wherever possible, not be connected to the same 0V terminal as the common 0V from digital signals. Terminals 3 and 11 should be used for connecting the 0V common of analog signals and terminals 21, 23 and 30 for digital signals. This is to prevent small voltage drops in the terminal connections causing inaccuracies in the analog signals.

Figure 4-27 **Default terminal functions** 

<sup>\*</sup> With software V01.07.00 and later, Analog input 3 is configured as a motor thermistor input. With software V01.06.02 and earlier, Analog input 3 has no default function. Refer to Analog input 3 on page 73.

#### 4.11.2 **Control terminal specification**

1	0V common	
Function	on	Common connection for all external devices

7 Analog input 2				
Default function	Frequency/speed reference			
Type of input	Bipolar single-ended analog voltage or unipolar current			
Mode controlled by	Pr <b>7.11</b>			
Operating in Voltage mode				
Full scale voltage range	±9.8V ±3%			
Maximum offset	±30mV			
Absolute maximum voltage range	±36V relative to 0V			
Input resistance	>100kΩ			
Operating in current mode	•			
Current ranges	0 to 20mA ±5%, 20 to 0mA ±5%, 4 to 20mA ±5%, 20 to 4mA ±5%			
Maximum offset	250μΑ			
Absolute maximum voltage (reverse bias)	-36V max			
Absolute maximum current	+70mA			
Equivalent input resistance	≤200Ω at 20mA			
Common to all modes				
Resolution	10 bit + sign			
Sample period	250µs when configured as voltage input with destinations as Pr 1.36, Pr 1.37, Pr 3.22 or Pr 4.08 in closed loop vector or servo mode. 4ms for open loop mode, all other destinations in closed loop vector or servo mode, or any destination when configured as a current input.			

8 Analog input 3					
Default function	V01.07.00 and later: Motor thermistor input (PTC) V01.06.02 and earlier: Not configured				
Type of input	Bipolar single-ended analog voltage, unipolar current or motor thermistor input				
Mode controlled by	Pr <b>7.15</b>				
Operating in Voltage mode (defau	alt)				
Voltage range	±9.8V ±3%				
Maximum offset	±30mV				
Absolute maximum voltage range	±36V relative to 0V				
Input resistance	>100kΩ				
Operating in current mode					
Current ranges	0 to 20mA ±5%, 20 to 0mA ±5%, 4 to 20mA ±5%, 20 to 4mA ±5%				
Maximum offset	250μΑ				
Absolute maximum voltage (reverse bias)	-36V max				
Absolute maximum current	+70mA				
Equivalent input resistance	≤200Ω at 20mA				
Operating in thermistor input mo	de				
Internal pull-up voltage	<5V				
Trip threshold resistance	3.3kΩ ±10%				
Reset resistance	1.8kΩ ±10%				
Short-circuit detection resistance	50Ω ±40%				
Common to all modes					
Resolution	10 bit + sign				
Sample period	250µs when configured as voltage input with destinations as Pr 1.36, Pr 1.37, Pr 3.22 or Pr 4.08 in closed loop vector or servo mode. 4ms for open loop mode, all other destinations in closed loop vector or servo mode, or any destination when configured as a current input.				

T8 analog input 3 has a parallel connection to terminal 15 of the drive encoder connector.

31	SAFE TORQUE OFF function (drive enable)			
Type		Positive logic only digital input		
Voltage	range	0V to +24V		
Absolute maximum applied voltage		±30V		
LogicThreshold		15.5V ±2.5V		
Low state maximum voltage for SIL3 and EN954-1 category 3		2V (or open-circuit)		
Respor	nse time	Nominal: 8ms Maximum: 20ms		

SAFE TORQUE OFF function has been approved by BGIA as meeting the requirements of the following standards, for the prevention of unexpected starting of the drive:

EN 61800-5-2:2007 SIL 3 EN ISO 13849-1:2006 PL e EN 954-1:1997 Category 3

The SAFE TORQUE OFF function may be used in a safety-related application in preventing the drive from generating torque in the motor to a high level of integrity. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards.

Refer to section 4.13 Safe torque off on page 77 for further information.

41 Relay contacts			
Default function	Drive OK indicator		
Contact voltage rating	240Vac, Installation over-voltage category II		
Contact maximum current rating	2A AC 240V 4A DC 30V resistive load 0.5A DC 30V inductive load (L/R = 40ms)

13	+V***											
14	0V common											
15						th**	*					

Marker pulse is optional

<sup>\*\*</sup> The U, V & W commutation signals are required with an incremental type encoder when used with a servo motor. The UVW commutation signals are used to define the motor position during the first  $120^{\circ}$  electrical rotation after the drive is powered-up or the encoder is initialized.

Simulated encoder output only available in open-loop

The encoder supply is selectable through parameter configuration to 5Vdc, 8Vdc and 15Vdc

<sup>\*\*\*\*</sup> Terminal 15 is a parallel connection to T8 analog input 3. If this is to be used as a thermistor input, ensure that Pr 7.15 is set to 'th.sc' (7), 'th' (8) or 'th.diSP' (9).

Safety SMARTCARD Optimization Diagnostics information information installation Installation started parameters the motor operation PLC parameters data information

#### NOTE

SSI encoders typically have maximum baud rate of 500kBaud. When a SSI only encoder is used for speed feedback with a closed loop vector or servo motor, a large speed feedback filter (Pr 3.42) is required due to the time taken for the position information to be transferred from the encoder into the drive. The addition of this filter means that SSI only encoders are not suitable for speed feedback in dynamic or high-speed applications.

## 4.12.1 Specifications

1	Channel Cos*					
2	Channel Cosref*					
3	Channel Sin*					
4	Channel Sinref*					
Type		Differential voltage				
Maxim	num Signal level	1.25V peak to peak (sin with regard to sinref and cos with regard to cosref)				
Maxim	num input frequency	See Table 4-16				
	num applied differential voltage ommon mode voltage range	±4V				

For the SinCos encoder to be compatible with Unidrive SP, the output signals from the encoder must be a 1V peak to peak differential voltage (across Sin to Sinref and Cos to Cosref).

The majority of encoders have a DC offset on all signals. Stegmann encoders typically have a 2.5Vdc offset. The Sinref and Cosref are a flat DC level at 2.5Vdc and the Cos and Sin signals have a 1V peak to peak waveform biased at 2.5Vdc.

Encoders are available which have a 1V peak to peak voltage on Sin, Sinref, Cos and Cosref. This results in a 2V peak to peak voltage seen at the drive's encoder terminals. It is not recommended that encoders of this type are used with Unidrive SP, and that the encoder feedback signals should meet the above parameters (1V peak to peak).

**Resolution:** The sinewave frequency can be up to 500kHz but the resolution is reduced at high frequency. Table 4-16 shows the number of bits of interpolated information at different frequencies and with different voltage levels at the drive encoder port. The total resolution in bits per revolution is the ELPR plus the number of bits of interpolated information. Although it is possible to obtain 11 bits of interpolation information, the nominal design value is 10 bits.

Not used with EndAt and SSI communications only encoders.

Table 4-16 Feedback resolution based on frequency and voltage level

## Common to all Encoder types

13	Encoder supply voltage	
Supply	y voltage	5.15V ±2%, 8V ±5% or 15V ±5%
•		300mA for 5V and 8V 200mA for 15V

The voltage on terminal 13 is controlled by Pr **3.36**. The default for this parameter is 5V (0) but this can be set to 8V (1) or 15V (2). Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device.

If the 15V encoder supply is selected then the termination resistors must be disabled.

The termination resistors should be disabled if the outputs from the encoder are higher than 5V.

14 0V common

## 5 Motor thermistor input

This terminal is connected internally to terminal 8 of the signal connector. Connect only one of these terminals to a motor thermistor. Analog input 3 must be in thermistor mode, Pr **7.15** = th.SC (7), th (8) or th.diSP (9).

## 4.13 Safe torque off

The SAFE TORQUE OFF function provides a means for preventing the drive from generating torque in the motor, with a very high level of integrity. It is suitable for incorporation into a safety system for a machine. It is also suitable for use as a conventional drive enable input.

The SAFE TORQUE OFF function makes use of the special property of an inverter drive with an induction motor, which is that torque cannot be generated without the continuous correct active behavior of the inverter circuit. All credible faults in the inverter power circuit cause a loss of torque generation.

The SAFE TORQUE OFF function is fail-safe, so when the SAFE TORQUE OFF input is disconnected the drive will not operate the motor, even if a combination of components within the drive has failed. Most component failures are revealed by the drive failing to operate. SAFE TORQUE OFF is also independent of the drive firmware. This meets the requirements of the following standards, for the prevention of operation of the motor.<sup>1</sup>

EN 61800-5-2:2007 SIL 3 (PFH  $\le 10^{-8}$ ) EN ISO 13849-1:2006 PL e (MTTF<sub>D</sub> >10<sup>5</sup> yr)

EN954-1:1997 Category 3

On drives with date code P04 and later the SAFE TORQUE OFF input also meets the requirements of EN 81-1 (clause 12.7.3 b) as part of a system for preventing unwanted operation of the motor in a lift (elevator).<sup>2</sup>

- <sup>1</sup> Independent approval has been given by BGIA.
- <sup>2</sup> Independent approval of concept has been given by TÜV. Please consult the separate guide for lift applications for further information.

SAFE TORQUE OFF can be used to eliminate electro-mechanical contactors, including special safety contactors, which would otherwise be required for safety applications.

Note on response time of SAFE TORQUE OFF, and use with safety controllers with self-testing outputs (drives with date code P04 and later).

SAFE TORQUE OFF has been designed to have a response time of greater than 1ms, so that it is compatible with safety controllers whose outputs are subject to a dynamic test with a pulse width not exceeding 1ms.

For applications where a fast-acting disable function is required, please see section 11.21.10 *Fast Disable* on page 242

Note on the use of servo motors, other permanent-magnet motors, reluctance motors and salient-pole induction motors

When the drive is disabled through SAFE TORQUE OFF, a possible (although highly unlikely) failure mode is for two power devices in the inverter circuit to conduct incorrectly.

This fault cannot produce a steady rotating torque in any AC motor. It produces no torque in a conventional induction motor with a cage rotor. If the rotor has permanent magnets and/or saliency, then a transient alignment torque may occur. The motor may briefly try to rotate by up to 180° electrical, for a permanent magnet motor, or 90° electrical, for a salient pole induction motor or reluctance motor. This possible failure mode must be allowed for in the machine design.

The design of safety-related control systems must only be done by personnel with the required training and experience. The SAFE TORQUE OFF function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

SAFE TORQUE OFF inhibits the operation of the drive, this includes inhibiting braking. If the drive is required to provide both braking and SAFE TORQUE OFF in the same operation (e.g. for emergency stop) then a safety timer relay or similar device must be used to ensure that the drive is disabled a suitable time after braking. The braking function in the drive is provided by an electronic circuit which is not fail-safe. If braking is a safety requirement, it must be supplemented by an independent fail-safe braking mechanism.

SAFE TORQUE OFF does not provide electrical isolation. The supply to the drive must be disconnected by an approved isolation device before gaining access to power connections.

Safety Product Mechanica SMARTCARE **UL** Listing Optimization Diagnostics operation information information installation Installation started parameters the motor PLC parameters information

#### Low voltage DC operation

With low voltage DC operation there is a reduction in the level of safety of the SAFE TORQUE OFF function. There exist certain unlikely faults which might permit the drive to produce some limited motor torque when disabled, but only if the DC supply has its negative pole connected to ground.

To prevent a loss of the safety function in the event of such a fault, one of the following methods can be used:

- Monitor the state of Pr 8.09. This parameter value should match the state of the enable input. If it does not match then there is a fault and further operation must be prevented.
- 2. Connect the positive pole of the DC supply to ground.
- 3. Connect neither pole of the DC supply to ground. Use a ground fault detection circuit to prevent further operation in the event of a ground fault in the DC circuit. If the detection circuit requires the supply to be biased relative to ground, ensure that the bias is negative, i.e. both DC rails are negative relative to ground.

Note that in lift (elevator) applications designed to meet EN 81-1 with the use of one contactor or no contactors, method 1 is normally implemented as part of the standard lift safety control system.

With SAFE TORQUE OFF there are no single faults in the drive which can permit the motor to be driven. Therefore it is not necessary to have a second channel to interrupt the power connection, nor a fault detection circuit.

It is important to note that a single short-circuit from the SAFE TORQUE OFF input to a DC supply of approximately +24V would cause the drive to be enabled. This can be excluded under EN ISO 13849-2 by the use of protected wiring. The wiring can be protected by either of the following methods:

- By placing the wiring in a segregated cable duct or other enclosure.
   or
- By providing the wiring with a grounded shield in a positive-logic grounded control circuit. The shield is provided to avoid a hazard from an electrical fault. It may be grounded by any convenient method; no special EMC precautions are required.

If the use of protected wiring is not acceptable, so that the possibility of this short circuit occurring is anticipated, then a relay must be used to monitor the state of the SAFE TORQUE OFF input, together with a single safety contactor to prevent operation of the motor after a fault.

For more information regarding the SAFE TORQUE OFF input, please see the *Control Techniques Safe Torque Off Engineering Guide* available for download from www.controltechniques.com.

## 5 Getting started

This chapter introduces the user interfaces, menu structure and security level of the drive.

## 5.1 Understanding the display

There are two keypads available for the Unidrive SP. The SM-Keypad has an LED display and the SM-Keypad Plus has an LCD display. Both keypads can be installed on the drive but the SM-Keypad Plus can also be remotely mounted on an enclosure door.

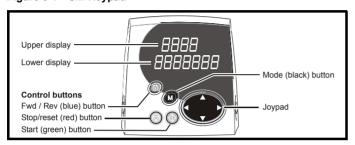

## 5.1.1 SM-Keypad (LED)

The display consists of two horizontal rows of 7 segment LED displays.

The upper display shows the drive status or the current menu and parameter number being viewed.

The lower display shows the parameter value or the specific trip type.

Figure 5-1 SM-Keypad

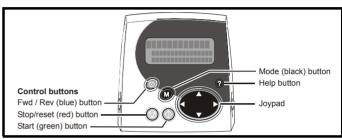

## 5.1.2 SM-Keypad Plus (LCD)

The display consists of three lines of text.

The top line shows the drive status or the current menu and parameter number being viewed on the left, and the parameter value or the specific trip type on the right.

The lower two lines show the parameter name or the help text.

Figure 5-2 SM-Keypad Plus

The red stop button is also used to reset the drive.

Both the SM-Keypad and the SM-Keypad Plus can indicate when a SMARTCARD access is taking place or when the second motor map is active (menu 21). These are indicated on the displays as follows.

	SM-Keypad	SM-Keypad Plus
SMARTCARD access taking place	The decimal point after the fourth digit in the upper display will flash.	The symbol 'CC' will appear in the lower left hand corner of the display
Second motor map active	The decimal point after the third digit in the upper display will flash.	The symbol 'Mot2' will appear in the lower left hand corner of the display

## 5.2 Keypad operation

## 5.2.1 Control buttons

The keypad consists of:

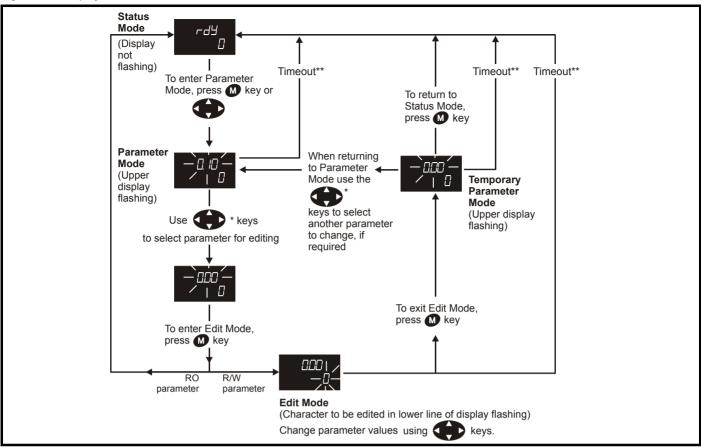

- 1. Joypad used to navigate the parameter structure and change parameter values.
- 2. Mode button used to change between the display modes parameter view, parameter edit, status.
- 3. Three control buttons used to control the drive if keypad mode is selected.
- 4. Help button (SM-Keypad Plus only) displays text briefly describing the selected parameter.

The Help button toggles between other display modes and parameter help mode. The up and down functions on the joypad scroll the help text to allow the whole string to be viewed. The right and left functions on the joypad have no function when help text is being viewed.

The display examples in this section show the SM-Keypad 7 segment LED display. The examples are the same for the SM-Keypad Plus except that the information displayed on the lower row on the SM-Keypad is displayed on the right hand side of the top row on the SM-Keypad Plus.

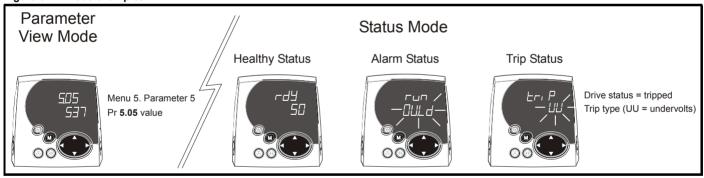

Figure 5-3 Display modes

\* Can only be used to move between menus if L2 access has been enabled (Pr **0.49**). Refer to section 5.9 on page 84.

\*\*Timeout defined by Pr **11.41** (default value = 240s).

Figure 5-4 Mode examples

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

## NOTE

When changing the values of parameters, make a note of the new values in case they need to be entered again.

#### NOTE

For new parameter-values to apply after the AC supply to the drive is interrupted, new values must be saved. Refer to section 5.7 Saving parameters on page 83.

#### 5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once level 2 access (L2) has been enabled (see Pr 0.49) the left and right buttons are used to navigate between menus. For further information, refer to section 5.9 Parameter access level and security on page 84.

Figure 5-5 Parameter navigation

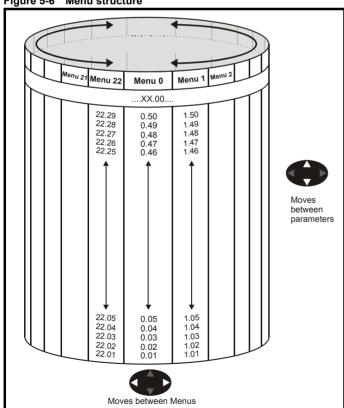

\* Can only be used to move between menus if L2 access has been enabled (Pr 0.49). Refer to section 5.9 Parameter access level and security on page 84.

The menus and parameters roll over in both directions.

i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

Figure 5-6 Menu structure

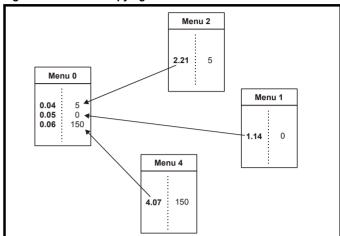

#### 5.4 Menu 0

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive.

Appropriate parameters are copied from the advanced menus into menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 Basic parameters on page 87.

Figure 5-7 Menu 0 copying

Product information Getting started Running the motor Onboard PLC UL Listing information Safety Mechanical Electrical Basic SMARTCARD Advanced Optimization Diagnostics information installation Installation parameters operation parameters

## 5.5 Advanced menus

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 22 can be viewed on all keypads. Menus 40 and 41 are specific to the SM-Keypad Plus (LCD). Menus 70 to 91 can be viewed with an SM-Keypad Plus (LCD) only when an SM-Applications is installed.

Table 5-1 Advanced menu descriptions

Menu	Description	LED	LCD
0	Commonly used basic set up parameters for quick / easy programming	✓	✓

## 5.5.2 Display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

Trip types are not listed here but can be found in Chapter 6 Basic parameters on page 87 if required.

Table 5-4 Alarm indications

Lower display	Description
br.rS	Braking resistor overload

Braking resistor  $I^2$ t accumulator (Pr **10.39**) in the drive has reached 75.0% of the value at which the drive will trip and the braking IGBT is active.

Hot	Heatsink or control board or inverter IGBT over	
поι	temperature alarms are active	

 The drive heatsink temperature has reached a threshold and the drive will trip 'Oh2' if the temperature continues to rise (see the 'Oh2' trip).

or

 The ambient temperature around the control PCB is approaching the over temperature threshold (see the 'O.CtL' trip).

OVLd Motor overload

The motor  $I^2t$  accumulator in the drive has reached 75% of the value at which the drive will be tripped and the load on the drive is >100%

## Auto tune Autotune in progress

The autotune procedure has been initialised. 'Auto' and 'tunE' will flash alternatively on the display.

Limit switch is active

Indicates that a limit switch is active and that it is causing the motor to be stopped (i.e. forward limit switch with forward reference etc).

PLC Onboard PLC program is running

An Onboard PLC program is installed and running. The lower display will flash 'PLC' once every 10s.

Table 5-5 Solutions Module and SMARTCARD status indications on power-up

Lower display	Description
boot	

A parameter set is being transferred from the SMARTCARD to the drive during power-up. For further information, please refer to section 9.2.4 Booting up from the SMARTCARD on every power up (Pr 11.42 = boot (4)) on page 130.

#### cArc

The drive is writing a parameter set to the SMARTCARD during powerup.

For further information, please refer to section 9.2.3 Auto saving parameter changes (Pr 11.42 = Auto (3)) on page 130.

## loAding

The drive is writing information to a Solutions Module.

## 5.6 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. (Pr **0.49** Security status and Pr **0.34** User security code are not affected by this procedure).

#### **Procedure**

Use the following procedure only if a different operating mode is required:

- Ensure the drive is not enabled, i.e. terminal 31 is open or Pr 6.15 is OFF (0)
- Enter either of the following values in Pr xx.00, as appropriate: 1253 (EUR, 50Hz AC supply frequency) 1254 (USA, 60Hz AC supply frequency)
- 3. Change the setting of Pr 0.48 as follows:

Pr 0.48 setting		Operating mode
048 0865 LP	1	Open-loop
048 EL UEEE	2	Closed-loop vector and RFC mode
048 58700	3	Closed-loop Servo
048 F898n	4	Free Standing drives are not intended to be used in regen mode

The figures in the second column apply when serial communications are used.

- 4. Either:
- Press the red reset button
- · Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

#### NOTE

Entering 1253 or 1254 in Pr **xx.00** will only load defaults if the setting of Pr **0.48** has been changed.

## 5.7 Saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the Mode button to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

## **Procedure**

Enter 1000\* in Pr. xx.00

Either

- Press the red reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

\*If the drive is in the under voltage trip state or is being supplied from a low voltage DC supply, a value of 1001 must be entered into Pr **xx.00** to perform a save function.

## 5.8 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drive's memory. (Pr **0.49** and Pr **0.34** are not affected by this procedure).

## **Procedure**

- Ensure the drive is not enabled, i.e. terminal 31 is open or Pr 6.15 is OFF (0)
- Enter 1233 (EUR 50Hz settings) or 1244 (USA 60Hz settings) in Pr xx.00.

Safety Mechanica SMARTCARD Optimization Diagnostics information information installation Installation started parameters the moto operation PLC parameters information

- 3. Either:
- Press the red n reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

#### 5.9 Parameter access level and security

The parameter access level determines whether the user has access to menu 0 only or to all the advanced menus (menus 1 to 22) in addition to

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in the table below:

Parameter Access Level	User Security	Menu 0 status	Advanced menus status
L1	Open	RW	Not visible
L1	Closed	RO	Not visible
L2	Open	RW	RW
L2	Closed	RO	RO

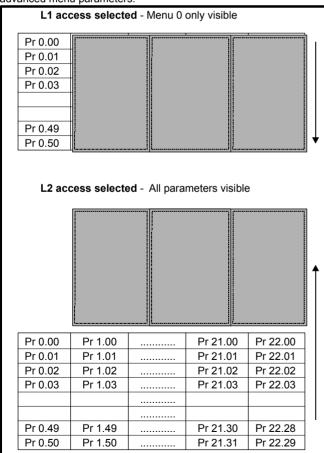

RW = Read / write access

RO = Read only access

The default settings of the drive are Parameter Access Level L1 and user Security Open, i.e. read / write access to Menu 0 with the advanced menus not visible

#### 5.9.1 **Access Level**

The access level is set in Pr 0.49 and allows or prevents access to the advanced menu parameters.

#### 5.9.2 Changing the Access Level

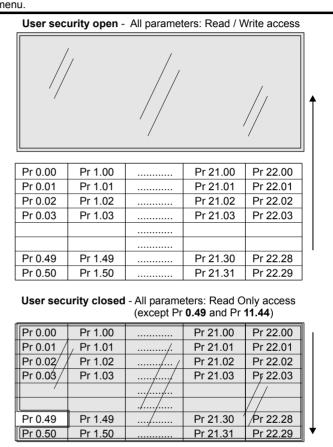

The Access Level is determined by the setting of Pr 0.49 as follows:

String	Value	Effect
L1	0	Access to menu 0 only
L2	1	Access to all menus (menu 0 to menu 22)

The Access Level can be changed through the keypad even if the User Security has been set.

#### 5.9.3 **User Security**

The User Security, when set, prevents write access to any of the parameters (other than Pr. 0.49 and Pr 11.44 Access Level) in any menu

#### **Setting User Security**

Enter a value between 1 and 999 in Pr **0.34** and press the **M** button; the security code has now been set to this value. In order to activate the security, the Access level must be set to Loc in Pr 0.49. When the drive is reset, the security code will have been activated and the drive returns to Access Level L1. The value of Pr 0.34 will return to 0 in order to hide the security code. At this point, the only parameter that can be changed by the user is the Access Level Pr 0.49.

#### **Unlocking User Security**

Select a read write parameter to be edited and press the M button, the upper display will now show CodE. Use the arrow buttons to set the security code and press the M button.

With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered the display will revert to parameter view mode.

To lock the User Security again, set Pr **0.49** to Loc and press the reset button.

Safety information information information information installation in

#### **Disabling User Security**

Unlock the previously set security code as detailed above. Set Pr 0.34 to 0 and press the button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

## 5.10 Displaying parameters with nondefault values only

By entering 12000 in Pr **xx.00**, the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **xx.00** and enter a value of 0.

Please note that this function can be affected by the access level enabled, refer to section 5.9 Parameter access level and security for further information regarding access level.

## 5.11 Displaying destination parameters only

By entering 12001 in  $\Pr$  **xx.00**, the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to  $\Pr$  **xx.00** and enter a value of 0.

Please note that this function can be affected by the access level enabled, refer to section 5.9 Parameter access level and security for further information regarding access level.

## 5.12 Serial communications

## 5.12.1 Introduction

The Unidrive SP has a standard 2-wire EIA485 interface (serial communications interface) which enables all drive set-up, operation and monitoring to be carried out with a PC or controller if required. Therefore, it is possible to control the drive entirely by serial communications without the need for a SM-keypad or other control cabling. The drive supports two protocols selected by parameter configuration:

- Modbus RTU
- CT ANSI

Modbus RTU has been set as the default protocol, as it is used with the PC-tools commissioning/start-up software as provided on the CD ROM.

The serial communications port of the drive is a RJ45 socket, which is isolated from the power stage and the other control terminals (see section 4.10 *Serial communications connections* on page 70 for connection and isolation details).

The communications port applies a 2 unit load to the communications network.

## **USB/EIA232 to EIA485 Communications**

An external USB/EIA232 hardware interface such as a PC cannot be used directly with the 2-wire EIA485 interface of the drive. Therefore a suitable converter is required.

Suitable USB to EIA485 and EIA232 to EIA485 isolated converters are available from Control Techniques as follows:

- CT USB Comms cable (CT Part No. 4500-0096)
- CT EIA232 Comms cable (CT Part No. 4500-0087)

When using one of the above converters or any other suitable converter with the Unidrive SP, it is recommended that no terminating resistors be connected on the network. It may be necessary to 'link out' the terminating resistor within the converter depending on which type is used. The information on how to link out the terminating resistor will normally be contained in the user information supplied with the converter.

## 5.12.2 Serial communications set-up parameters

The following parameters need to be set according to the system requirements.

0.3	5 {1	1.24}	Serial	mode					
R۱	Ν	Txt						US	
<b>Û</b>			AnSI ( rtU (1	,	ightharpoons		rtU (1	1)	

This parameter defines the communications protocol used by the 485 comms port on the drive. This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original protocol. The master should wait at least 20ms before send a new message using the new protocol. (Note: ANSI uses 7 data bits, 1 stop bit and even parity; Modbus RTU uses 8 data bits, 2 stops bits and no parity).

Comms value	String	Communications mode
0	AnSI	ANSI
1	rtU	Modbus RTU protocol
2	Lcd	Modbus RTU protocol, but with an SM- Keypad Plus only

## ANSIx3.28 protocol

Full details of the CT ANSI communications protocol are the *Advanced User Guide*.

#### Modbus RTU protocol

Full details of the CT implementation of Modbus RTU are given in the *Advanced User Guide*.

#### Modbus RTU protocol, but with an SM-Keypad Plus only

This setting is used for disabling communications access when the SM-Keypad Plus is used as a hardware key. See the *Advanced User Guide* for more details.

0.3	6 {1	1.25}	Serial	comm	unicat	ions	s ba	ud rate	Э		
R۱	Ν	Txt								US	
<b></b>		300 (0), 400 (3), 1920( 57600	4800 ( 0 (6), 3	4), 960 8400 (7	0 (5), 7),	↔			19200	(6)	

<sup>\*</sup> only applicable to Modbus RTU mode

This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20ms before sending a new message using the new baud rate.

#### NOTE

When using the CT EIA232 Comms cable the available baud rate is limited to 19 2k baud

0.3	7 {1	11.23}	Serial	comm	unicati	ions	s ad	dress			
R۷	٧	Txt								US	
<b>Û</b>			0 to 2	47		$\Rightarrow$			1		

Used to define the unique address for the drive for the serial interface. The drive is always a slave.

information	information	installation	Installation	Starteu	parameters	the motor	-	operation	PLC	parameters	data	-	information
4					•					•			

#### **Modbus RTU**

When the Modbus RTU protocol is used addresses between 0 and 247 are permitted. Address 0 is used to globally address all slaves, and so this address should not be set in this parameter

#### ANSI

When the ANSI protocol is used the first digit is the group and the second digit is the address within a group. The maximum permitted group number is 9 and the maximum permitted address within a group is 9. Therefore, Pr **0.37** is limited to 99 in this mode. The value 00 is used to globally address all slaves on the system, and x0 is used to address all slaves of group x, therefore these addresses should not be set in this parameter.

6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in menu 0 appear in other menus in the drive (denoted by {...}).

Menus 11 and 22 can be used to change most of the parameters in menu 0. Menu 0 can also contain up to 59 parameters by setting up menu 22.

<sup>\*</sup> Modes 1 and 2 are not user saved, Modes 0, 3 and 4 are user saved **Key:** 

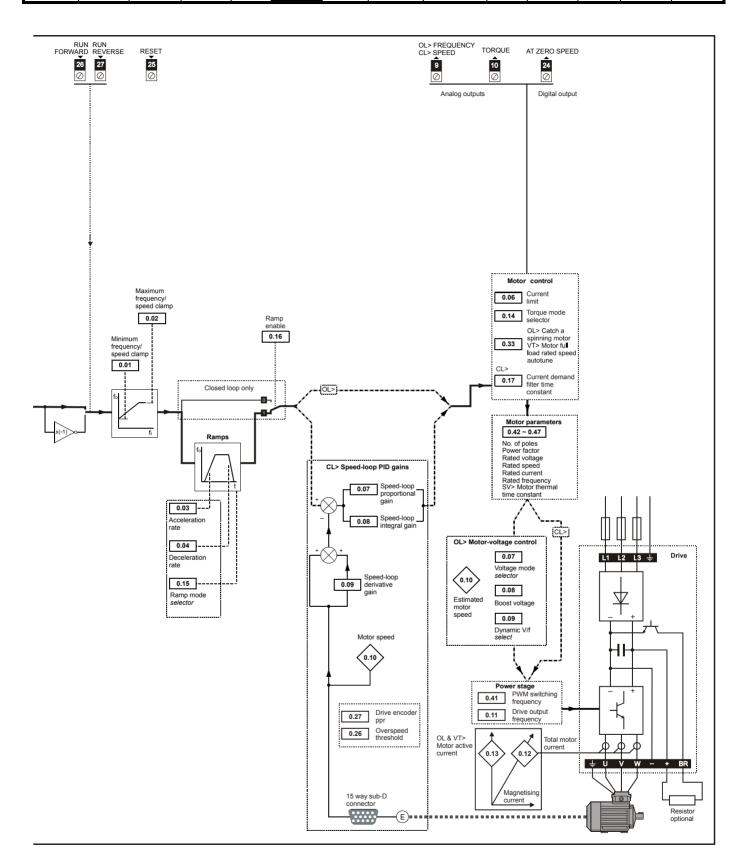

Coding	Attribute
OL	Open loop
CL	Closed loop vector and Servo
VT	Closed loop vector
SV	Servo
{X.XX}	Copied advanced parameter
RW	Read/write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter: 'On' or 'OFF' on the display
Bi	Bipolar parameter
Uni	Unipolar parameter
Txt	Text: the parameter uses text strings instead of numbers.
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.

Coding	Attribute
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will not be transferred to the destination drive by SMARTCARDs when the rating of the destination drive is different from the source drive and the file is a parameter file. However, with software V01.09.00 and later the value will be transferred if only the current rating is different and the file is a differences from default type file.
NC	Not copied: not transferred to or from SMARTCARDs during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) trip occurs. With software version V01.08.00 and later, power-down save parameters are also saved in the drive when the user initiates a parameter save.

## 6.2 Full descriptions

## 6.2.1 Parameter x.00

0.0	00 {	x.00}	Param	eter ze	ero				
R۷	N	Uni							
<b>Û</b>		(	0 to 32,	767		$\Rightarrow$		0	

Pr x.00 is available in all menus and has the following functions.

Value	Action
1000	Save parameters when under voltage is not active (Pr 10.16
	= 0) and low voltage DC supply is not active (Pr <b>6.44</b> = 0).
1001	Save parameters under all conditions
1070	Reset all option modules
1233	Load standard defaults
1244	Load US defaults
1253	Change drive mode with standard defaults
1254	Change drive mode with US defaults
1255	Change drive mode with standard defaults (excluding menus 15 to 20)
1256	Change drive mode with US defaults (excluding menus 15 to 20)
2001*	Transfer drive parameters as difference from default to a bootable SMARTCARD block in data block number 001
Зууу*	Transfer drive EEPROM data to a SMARTCARD block number yyy
4yyy*	Transfer drive data as difference from defaults to SMARTCARD block number yyy
5ууу*	Transfer drive ladder program to SMARTCARD block number yyy
6yyy*	Transfer SMARTCARD data block number yyy to the drive
7yyy*	Erase SMARTCARD data block number yyy
8ууу*	Compare drive parameters with SMARTCARD data block number yyy
9555*	Clear SMARTCARD warning suppression flag
9666*	Set SMARTCARD warning suppression card
9777*	Clear SMARTCARD read-only flag
9888*	Set SMARTCARD read-only flag
9999*	Erase SMARTCARD data block 1 to 499
110zy	Transfer electronic nameplate parameters to/from drive from/ to encoder. See the <i>Advanced User Guide</i> for more information on this function.
12000**	Display non-default values only
12001**	Display destination parameters only

<sup>\*</sup> See Chapter 9 SMARTCARD operation on page 128 for more information of these functions.

## 6.2.2 Speed limits

0.0	01 {	1.07}	Minim	um ref	erence	Minimum reference clamp									
R۱	N	Bi							PT	US					
OL	<b>Û</b>		±550.0 Hz						0.0						
CL	<b>Û</b>	±SPEE	D_LIMI	T_MAX	Hz/rpm	$\Diamond$			0.0						

(When the drive is jogging, [0.01] has no effect).

## Open-loop

Set Pr 0.01 at the required minimum output frequency of the drive for both directions of rotation. The drive speed reference is scaled between Pr 0.01 and Pr 0.02. [0.01] is a nominal value; slip compensation may cause the actual frequency to be higher.

#### Closed-loop

Set Pr 0.01 at the required minimum motor speed for both directions of rotation. The drive speed reference is scaled between Pr 0.01 and Pr 0.02.

0.0	)2 {	1.06}	Maxim	num re	ferenc	ес	lamp	)
R۱	N	Uni						US
OL	⇕		0 to 55	0.0 Hz		$\Rightarrow$		EUR> 50.0 USA> 60.0
CL	<b>Û</b>	SPEEI	_MAX I	Hz/rpm	$\Rightarrow$	VT	EUR> 1,500.0 USA> 1,800.0	
	v						sv	3,000.0

(The drive has additional over-speed protection).

#### Open-loop

Set Pr 0.02 at the required maximum output frequency for both directions of rotation. The drive speed reference is scaled between Pr 0.01 and Pr 0.02. [0.02] is a nominal value; slip compensation may cause the actual frequency to be higher.

#### Closed-loop

Set Pr 0.02 at the required maximum motor speed for both directions of rotation. The drive speed reference is scaled between Pr 0.01 and Pr 0.02.

For operating at high speeds see section 8.6 *High speed operation* on page 126.

## 6.2.3 Ramps, speed reference selection, current limit

	0.0	3 (2	2.11}	Accel	eratior	n rate					
	R۷	V	Uni							US	
0	)L	<b>Û</b>	0.0 t	o 3,200	).0 s/10	00Hz	$\Rightarrow$		5.0		
С	ı	0.000 to 3,200.000					Û	VT	2.0	000	
ľ	s/1,000rpm						sv	0.2	200		

Set Pr 0.03 at the required rate of acceleration.

Note that larger values produce lower acceleration. The rate applies in both directions of rotation.

0.0	)4 {	2.21}	Decel	eratior	rate					
R۱	N	Uni							US	
OL	<b>Û</b>	0.0 t	0.0 to 3,200.0 s/100Hz					10.0		
CL	⇧	0.0	000 to 3	3,200.0	00	Û	VT	2.0	00	
<u> </u>	•		s/1,00	00rpm		Í	sv	0.2	00	

Set Pr 0.04 at the required rate of deceleration.

Note that larger values produce lower deceleration. The rate applies in both directions of rotation.

<sup>\*\*</sup> These functions do not require a drive reset to become active. All other functions require a drive reset to initiate the function.

₹,		, to Out	iiciii_iii		1X /U		CL	17:	5.0	

Pr **0.06** limits the maximum output current of the drive (and hence maximum motor torque) to protect the drive and motor from overload.

Set Pr **0.06** at the required maximum torque as a percentage of the rated torque of the motor, as follows:

$$[0.06] = \frac{T_R}{T_{RATED}} \times 100 (\%)$$

Where:

T<sub>R</sub> Required maximum torque

T<sub>RATED</sub> Motor rated torque

Alternatively, set 0.06 at the required maximum active (torque-producing) current as a percentage of the rated active current of the motor, as follows:

$$[0.06] = \frac{I_R}{I_{RATED}} \times 100 \, (\%)$$

Where:

I<sub>R</sub> Required maximum active current

I<sub>RATED</sub> Motor rated active current

# 6.2.4 Voltage boost, (open-loop), Speed-loop PID gains (closed-loop)

0.0	)7 {	5.14}	Voltag	je mod	le sele	cto	•			
R۱	N	Txt							US	
OL	\$	Ur_S Ur_	i (0), Ui Auto (3 SrE		d (2), (4),	$\Rightarrow$		Ur_l (4	4)	

## Open-loop

There are six voltage modes available, which fall into two categories, vector control and fixed boost. For further details, refer to section *Pr 0.07 {5.14} Voltage mode* on page 116.

	0.0	7 {	3.10}	Speed	l contr	oller p	rop	ortic	onal ga	in		
	R۷	٧	Uni								US	
	:1	⇧	0.	0000 to		35	Û	VT		0.0	300	
ľ	_	•		1/rad	d s <sup>-1</sup>			sv		0.0	100	

Software V01.10.00 and later, the defaults are as above.

Software V01.09.01 and earlier, the default is 0.0100 in Closed-loop vector and servo mode.

#### Closed-loop

Pr **0.07** (**3.10**) operates in the feed-forward path of the speed-control loop in the drive. See Figure 11-4 on page 154 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 115.

0.	80	5.15}	Low f	requer	icy vol	tag	e bo	ost			
R'	W	Uni								US	
OL	<b>Û</b>		to 25.0 rated v			$\Rightarrow$			1.0		

#### Open-loop

When **0.07** Voltage mode selector is set at **Fd** or **SrE**, set Pr **0.08** (5.15) at the required value for the motor to run reliably at low speeds.

Excessive values of Pr 0.08 can cause the motor to be overheated.

0.0	8 (	3.11}	Speed	Speed controller i				gain			
R۱	٧	Uni								US	
CL	⇧		0.00 to 655.35 1/rad		5				0.1	10	
5	•								1.0	00	

Software V01.10.00 and later, the defaults are as above.

Software V01.09.01 and earlier, the default is 1.00 in Closed-loop vector and servo modes.

## Closed-loop

Pr **0.08** (**3.11**) operates in the feed-forward path of the speed-control loop in the drive. See Figure 11-4 on page 154 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 115.

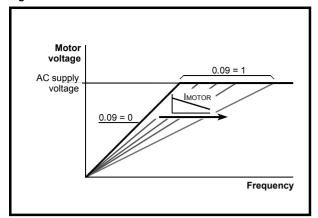

0.0	)9 {	5.13}	Dynar	nic V/F	/ flux	opt	imiz	e selec	t		
R۱	N	Bit								US	
OL	<b>ŷ</b>	0	FF (0)	or On (	1)	$\Diamond$			OFF (	0)	

## Open-loop

Set Pr 0.09 (5.13) at 0 when the V/f characteristic applied to the motor is to be fixed. It is then based on the rated voltage and frequency of the motor.

Set Pr **0.09** at 1 when reduced power dissipation is required in the motor when it is lightly loaded. The V/f characteristic is then variable resulting in the motor voltage being proportionally reduced for lower motor currents. Figure 6-2 shows the change in V/f slope when the motor current is reduced.

Figure 6-2 Fixed and variable V/f characteristics

0.0	)9 {	3.12}	Speed	l contr	oller d	iffe	renti	ial feed	back g	ain	
R۱	N	Uni								US	
CL	<b>Û</b>	0.00	0000 to 0.65535(s)			$\Diamond$			0.0000	00	

## Closed-loop

Pr **0.09** (**3.12**) operates in the feedback path of the speed-control loop in the drive. See Figure 11-4 on page 154 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 115.

## 6.2.5 Monitoring

I	0.1	10 {	5.04}	Estim	ated m	otor s	pee	d			
	R	О	Bit	FI					NC	PT	
	OL	${\bf \hat{v}}$		±180,000 rpm			$\Diamond$				

## Open-loop

Pr **0.10** (5.04) indicates the value of motor speed that is estimated from the following:

- 0.12 Post-ramp frequency reference
- 0.42 Motor no. of poles

Ī	0.1	10 {	3.02}	Motor	speed	ı				
	R	0	Bi	FI				NC	PT	
	VT	<b>Û</b>	±S	Speed_max rpm			$\Diamond$			

## Closed-loop

Pr **0.10** (**3.02**) indicates the value of motor speed that is obtained from the speed feedback.

0.	11 {	5.01}	Drive	output	freque	enc	/			
R	0	Bi	FI					NC	PT	
OL	<b>Û</b>	±SPE	ED_FR	EQ_M	AX Hz	$\hat{\Box}$				
VT	<b>Û</b>		±550.0 Hz			$\Rightarrow$				

## Open-loop & closed loop vector

Pr 0.11 displays the frequency at the drive output.

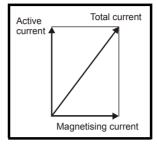

I	0.1	11 {	3.29}	.29} Drive encoder pos							
	R	C	Uni	FI					NC	PT	
	sv	≎	0 to 65,535 1/2 <sup>16</sup> ths of a revolution			ution	$\Rightarrow$				

## Servo

Pr **0.11** displays the position of the encoder in mechanical values of 0 to 65,535. There are 65,536 units to one mechanical revolution.

I	0.1	12 {	4.01}	Total r	notor o	current				
	R	C	Uni	FI				NC	PT	
	<b>Û</b>	(	to Dri	ve_current_max A			$\Rightarrow$			

Pr **0.12** displays the rms value of the output current of the drive in each of the three phases. The phase currents consist of an active component and a reactive component, which can form a resultant current vector as shown in the following diagram.

The active current is the torque producing current and the reactive current is the magnetizing or flux-producing current.

0.13	{4.02}	Motor	active	currer	ıt			
RO	Bi	FI				NC	PT	
OL VT	±Dri	ive_cur	rent_m	ax A	$\Rightarrow$			

#### Open-loop & closed loop vector

When the motor is being driven below its rated speed, the torque is proportional to [0.13].

0.	13 {	7.07}	Analo	g inpu	t 1 offs	et t	rim			
R	W	Bi							US	
sv	<b>ŷ</b>		±10.0	000 %		$\Rightarrow$		0.00	0	

## Servo

Pr **0.13** can be used to trim out any offset in the user signal to analog input 1.

## 6.2.6 Jog reference, Ramp mode selector, Stop and torque mode selectors

	0.1	4 {	4.11}	Torqu	e mode	e selec	tor				
	RW	/	Uni							US	
0	L	<b>Û</b>		0 to 1				Speed control (0)			
С	L	<b>Û</b>		0 to 4			$\Box$	Орк	ca coi	11101 (0)	

Pr 0.14 is used to select the required control mode of the drive as follows:

Setting	Open-Loop	Closed-Loop
0	Frequency control	Speed control
1	Torque control	Torque control
2		Torque control with speed override
3		Coiler/uncoiler mode
4		Speed control with torque feed- forward

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

0.	15 {	2.04}	Ramp	mode	select					
R۱	Ν	Txt							US	
OL	<b>Û</b>		Std	it (0) (1) IV (2)		⇧		Std (	1)	
CL	<b>Û</b>	FASt (0) Std (1)				$\Diamond$				

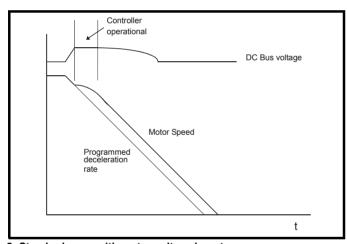

Pr **0.15** sets the ramp mode of the drive as shown below:

#### 0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits. This mode must be used if a braking resistor is connected to the drive.

#### 1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr 2.08) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr 2.08) is set lower than the nominal DC bus level the drive will not decelerate the motor, but it will coast to rest. The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (Closed-loop vector or Servo modes). The gain of these controllers can be modified with Pr 4.13 and Pr 4.14.

## 2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20%. This increases the losses in the motor, dissipating some of the mechanical energy as heat giving faster deceleration.

0	.16 {	8.39}	T28 a	nd T29	auto-s	sele	ctio	n disab	le		
F	RW	Bit								US	
OI	<b>-</b> Û								OFF (	0)	

## Open-loop

When Pr **0.16** is set to 0, digital inputs T28 and T29 are set up automatically with destinations according to the setting of the reference select Pr **0.05**.

Ref	erence select 0.05	Terminal 28 function	Terminal 29 function
A1.A2 (0)	Reference selection by terminal input	Local / remote selector	Jog select
A1.Pr (1)	Analog reference 1 or presets selected by terminal input	Preset select bit 0	Preset select bit 1
A2.Pr (2)	Analog reference 2 or presets selected by terminal input	Preset select bit 0	Preset select bit 1
Pr (3)	Preset reference selected by terminal input	Preset select bit 0	Preset select bit 1
PAd (4)	Keypad reference selected	Local / remote selector	Jog select
Prc (5)	Precision reference selected	Local / remote selector	Jog select

Setting Pr **0.16** to 1 disables this automatic set-up, allowing the user to define the function of digital inputs T28 and T29.

0.1	16 {	2.02}	Ramp	enabl	9					
R۱	Ν	Bit							US	
CL	<b>Û</b>	0	FF (0)	or On (	1)	$\Diamond$		On (1	)	

## Closed-loop

Setting Pr **0.16** to 0 allows the user to disable the ramps. This is generally used when the drive is required to closely follow a speed reference which already contains acceleration and deceleration ramps.

0.1	17 {	8.26}	T29 di	igital ir	put de	stir	atio	on			
R۷	Ν	Uni		DE					PT	US	
OL	<b>Û</b>	Pr	<b>0.00</b> to	Pr <b>21</b> .	51	$\Rightarrow$			Pr <b>6.</b> 3	31	

## Open-loop

Pr **0.17** sets the destination of digital input T29. This parameter is normally set-up automatically according to the reference selected by Pr **0.05**. In order to manually set-up this parameter, the T28 and T29 auto-selection disable (Pr **0.16**) must be set.

0.1	17 {	4.12}	Curre	nt dem	and filt	ter 1	time	const	ant		
RW Uni										US	
CL	CL 🔃 0.0 to 25.0 ms				;	$\Rightarrow$			0.0		

#### Closed-loop

A first order filter, with a time constant defined by Pr **0.17**, is provided on the current demand to reduce acoustic noise and vibration produced as a result of position feedback quantization noise. The filter introduces a lag in the speed loop, and so the speed loop gains may need to be reduced to maintain stability as the filter time constant is increased.

VT	${\bf \hat{v}}$		0 to 2					0		

#### Closed-loop vector

The motor rated full load rpm parameter (Pr 0.45) in conjunction with the motor rated frequency parameter (Pr 0.46) defines the full load slip of the motor. The slip is used in the motor model for closed-loop vector control. The full load slip of the motor varies with rotor resistance which can vary significantly with motor temperature. When Pr 0.33 is set to 1 or 2, the drive can automatically sense if the value of slip defined by Pr 0.45 and Pr 0.46 has been set incorrectly or has varied with motor temperature. If the value is incorrect parameter Pr 0.45 is automatically adjusted. The adjusted value in Pr 0.45 is not saved at power-down. If the new value is required at the next power-up it must be saved by the user.

Automatic optimization is only enabled when the speed is above 12.5% of rated speed, and when the load on the motor load rises above 62.5% rated load. Optimization is disabled again if the load falls below 50% of rated load.

For best optimization results the correct values of stator resistance (Pr **5.17**), transient inductance (Pr **5.24**), stator inductance (Pr **5.25**) and saturation breakpoints (Pr **5.29**, Pr **5.30**) should be stored in the relevant parameters. These values can be obtained by the drive during an autotune (see Pr **0.40** for further details).

Rated rpm auto-tune is not available if the drive is not using external position/speed feedback.

The gain of the optimizer, and hence the speed with which it converges, can be set at a normal low level when Pr **0.33** is set to 1. If this parameter is set to 2 the gain is increased by a factor of 16 to give faster convergence.

0.3	34 {1	11.30}	User s	securit	y code					
R	W	Uni	Uni					NC	PT	PS
<b>Û</b>	0 to 999					$\Rightarrow$			0	

If any number other than 0 is programmed into this parameter, user security is applied so that no parameters except parameter **0.49** can be adjusted with the keypad. When this parameter is read via a keypad it appears as zero.

For further details refer to section 5.9.3 User Security on page 84.

0.35 {11.24} Serial comms mode											
RV	٧	Txt								US	
<b>Û</b>		AnSI (	0), rtu (	1), Lcd	(2)	$\Rightarrow$			rtU (1	1)	

This parameter defines the communications protocol used by the EIA485 comms port on the drive. This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original protocol. The master should wait at least 20ms before send a new message using the new protocol. (Note: ANSI uses 7 data bits, 1 stop bit and even parity; Modbus RTU uses 8 data bits, 2 stops bits and no parity).

R	W	Txt							US	
<b>Û</b>				4), 960 8400 (7	0 (5), 7),	$\Rightarrow$		19200	(6)	

<sup>\*</sup> only applicable to Modbus RTU mode

This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20ms before send a new message using the new baud rate.

0.3	7 {1	11.23}	Serial	comm	s addr	ess								
R۱	N	V Uni US US												
$\hat{\mathbb{O}}$			0 to 2	47		$\qquad \qquad $			1					

Used to define the unique address for the drive for the serial interface. The drive is always a slave.

## **Modbus RTU**

When the Modbus RTU protocol is used addresses between 0 and 247 are permitted. Address 0 is used to globally address all slaves, and so this address should not be set in this parameter

#### **ANSI**

When the ANSI protocol is used the first digit is the group and the second digit is the address within a group. The maximum permitted group number is 9 and the maximum permitted address within a group is 9. Therefore, Pr **0.37** is limited to 99 in this mode. The value 00 is used to globally address all slaves on the system, and x0 is used to address all slaves of group x, therefore these addresses should not be set in this parameter.

OL	<b>Û</b>		0 to	o 2	$\Box$		0	
VT	<b>Û</b>		0 to	o 4	$\Diamond$		0	
sv	<b>Û</b>		0 to	o 6	$\Diamond$		0	

#### Open-Loop

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible, so the measured value of power factor of the motor is used by the drive.

- The stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft.
- A rotating autotune first performs a stationary autotune, before rotating the motor at <sup>2</sup>/<sub>3</sub> base speed in the forward direction for several seconds. The motor must be free from load for the rotating autotune

To perform an autotune, set Pr **0.40** to 1 for a stationary test or 2 for a rotating test, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

To perform an autotune, set Pr **0.40** to 1 for a stationary test or 2 for a rotating test, and provide the drive with an enable signal (on terminal 31) and press the green (hand) button.

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

For further information refer to section *Pr 0.40 {5.12} Autotune* on page 115.

## Closed-loop

There are three autotune tests available in closed loop vector mode, a stationary test, a rotating test and an inertia measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

- The stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft.
- A rotating autotune first performs a stationary autotune, before
  rotating the motor at <sup>2</sup>/<sub>3</sub> base speed in the forward direction for
  approximately 30 seconds. The motor must be free from load for the
  rotating autotune.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

• The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains, below) and to provide torque feed forwards when required during acceleration. During the inertia measurement test the motor speed changes from <sup>1</sup>/<sub>3</sub> to <sup>2</sup>/<sub>3</sub> rated speed in the forward direction several times. The motor can be loaded with a constant torque load and still give an accurate result, however, non-linear loads and loads that change with speed will cause measurement errors.

To perform an autotune, set Pr **0.40** to 1 for a stationary test, 2 for a rotating test, or 3 for an inertia measurement test and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

Setting Pr **0.40** to 4 will cause the drive to calculate the current loop gains based on the previously measured values of motor resistance and inductance. The drive does apply any voltage to the motor during this test. The drive will change Pr **0.40** back to 0 as soon as the calculations are complete (approximately 500ms).

For further information refer to section  $\mbox{\it Pr 0.40 \{5.12\} Autotune}}$  on page 118.

#### Servo

There are five autotune tests available in servo mode, a short low speed test, a normal low speed test, an inertia measurement test, a stationary test and a minimal movement test. A normal low speed should be done where possible as the drive measures the stator resistance and inductance of the motor, and from these calculates the current loop gains. An inertia measurement test should be performed separately to a short low speed or normal low speed autotune.

- A short low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the forward direction, and measure the encoder phase angle. The motor must be free from load for this test.
- A normal low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the forward direction. This test measures the encoder phase angle and updates other parameters including the current loop gains. The motor must be free from load for this test.
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains and to provide torque feed forwards when required during acceleration. During the inertia measurement test the motor speed changes from <sup>1</sup>/<sub>3</sub> to <sup>2</sup>/<sub>3</sub> rated speed in the forward direction several times. The motor can be loaded with a constant torque load and still give an accurate result, however, non-linear loads and loads that change with speed will cause measurement errors.
- The stationary test only measures the motor resistance and inductance, and updates the current loop gain parameters. This test does not measure the encoder phase angle so this test needs to be done in conjunction with either the short low speed or minimal movement tests.
- The minimal movement test will move the motor through a small angle to measure the encoder phase angle. This test will operate correctly when the load is an inertia, and although a small amount of cogging and stiction is acceptable, this test cannot be used for a loaded motor.

To perform an autotune, set Pr **0.40** to 1 for a short low speed test, 2 for a normal low speed test, 3 for an inertia measurement test, 4 for a stationary test or 5 for a minimal movement test, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

Setting Pr **0.40** to 6 will cause the drive to calculate the current loop gains based on the previously measured values of motor resistance and inductance. The drive does apply any voltage to the motor during this test. The drive will change Pr **0.40** back to 0 as soon as the calculations are complete (approximately 500ms).

For further information refer to section *Pr 0.40 {5.12} Autotune* on page 121.

0.4	<b>41</b> {	5.18}	Maxin	num sv	witchin	g fı	equ	ency			
R۱	Ν	Txt				F	RA			US	
OL						$\Diamond$			3 (0)		
CI	${\bf \hat{v}}$	3	(0), 4 (	(1), 6 (2	2)	Û	VT		3 (	(0)	
CL						ŕ	sv		6 (	(2)	

This parameter defines the required switching frequency. The drive may automatically reduce the actual switching frequency (without changing this parameter) if the power stage becomes too hot. A thermal model of the IGBT junction temperature is used based on the heatsink temperature and an instantaneous temperature drop using the drive output current and switching frequency. The estimated IGBT junction temperature is displayed in Pr 7.34. If the temperature exceeds 145°C the switching frequency is reduced if this is possible (i.e >3kHz). Reducing the switching frequency reduces the drive losses and the junction temperature displayed in Pr 7.34 also reduces. If the load condition persists the junction temperature may continue to rise again above 145°C and the drive cannot reduce the switching frequency further the drive will initiate an 'O.ht1' trip. Every second the drive will attempt to restore the switching frequency to the level set in Pr 0.41.

The full range of switching frequencies is not available on all ratings of Unidrive SP. See section 8.5 *Switching frequency* on page 126, for the maximum available switching frequency for each drive rating.

## 6.2.7 Motor parameters

0	).4	2 {	5.11}	No. of	moto	r poles					
F	₹۷	V	Txt							US	
OI	L	${\bf \hat{v}}$					$\Box$		Auto (	0)	
CI		⇧	0 to 60	) (Auto	to 120	Pole)	Û	VT	Auto	0)	
L	_	V						sv	6 POI	-E (3)	

## Open-loop

This parameter is used in the calculation of motor speed, and in applying the correct slip compensation. When auto is selected, the number of motor poles is automatically calculated from the rated frequency (Pr 0.47) and the rated full load rpm (Pr 0.45). The number of poles = 120 \* rated frequency / rpm rounded to the nearest even number.

## Closed-loop vector

This parameter must be set correctly for the vector control algorithms to operate correctly. When auto is selected, the number of motor poles is automatically calculated from the rated frequency (Pr **0.47**) and the rated full load rpm (Pr **0.45**). The number of poles = 120 \* rated frequency / rpm rounded to the nearest even number.

#### Servo

This parameter must be set correctly for the vector control algorithms to operate correctly. When auto is selected the number of poles is set to 6.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

0.4	43 {	5.10}	Motor	rated	power	factor	•			
R۱	Ν	Uni							US	
OL	<b>Û</b>		0.000 to	n 1 000	١	$\Diamond$		0.85	n	
VT	<b>Û</b>		0.000 1	3 1.000	,	$\Rightarrow$		0.00	O	

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current.

#### Open-loop

The power factor is used in conjunction with the motor rated current (Pr **0.46**) to calculate the rated active current and magnetizing current of the motor. The rated active current is used extensively to control the drive, and the magnetizing current is used in vector mode Rs compensation. It is important that this parameter is set up correctly.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **0.43**.

#### Closed-loop vector

If the stator inductance (Pr **5.25**) contains a non-zero value, the power factor used by the drive is continuously calculated and used in the vector control algorithms (this will not update Pr **0.43**).

If the stator inductance is set to zero (Pr **5.25**) then the power factor written in Pr **0.43** is used in conjunction with the motor rated current and other motor parameters to calculate the rated active and magnetizing currents which are used in the vector control algorithm.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **0.43**.

0.4	43 {	3.25}	Encod	ler pha	se ang	le				
R۱	Ν	Uni							US	
S۷	<b>Û</b>		0.0 to	$\Rightarrow$		0.0				

The phase angle between the rotor flux in a servo motor and the encoder position is required for the motor to operate correctly. If the phase angle is known it can be set in this parameter by the user. Alternatively the drive can automatically measure the phase angle by performing a phasing test (see autotune in servo mode Pr 0.40). When the test is complete the new value is written to this parameter. The encoder phase angle can be modified at any time and becomes effective immediately. This parameter has a factory default value of 0.0, but is not affected when defaults are loaded by the user.

#### Open-loop & Closed-loop vector

Enter the value from the rating plate of the motor.

0.4	<del>1</del> 5 {	5.08}	Motor	rated	full loa	ad s	pee	d (rpm)	)		
R۱	N	Uni								US	
OL	<b>Û</b>	0	to 180,	000 rp	m	$\Box$			UR> 1 JSA> 1		
VT	<b>Û</b>	0.00	to 40,0	00.00	rpm	$\Diamond$			IR> 1,4 SA> 1,7		

#### Open-loop

This is the speed at which the motor would rotate when supplied with its base frequency at rated voltage, under rated load conditions (= synchronous speed - slip speed). Entering the correct value into this parameter allows the drive to increase the output frequency as a function of load in order to compensate for this speed drop.

Slip compensation is disabled if Pr 0.45 is set to 0 or to synchronous speed, or if Pr 5.27 is set to 0.

If slip compensation is required this parameter should be set to the value from the rating plate of the motor, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

#### **Closed loop vector**

Rated load rpm is used with motor rated frequency to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter can result in the following:

- · Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- · Failure to reach maximum speed
- · Over-current trips
- · Reduced transient performance
- · Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot machine, however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate.

The rated full load rpm can be optimized by the drive (For further information, refer to section 8.1.3 *Closed loop vector motor control* on page 120).

Setting		Operating mode
OPEn LP	1	Open-loop
CL VECt	2	Closed-loop vector
SerVO	3	Servo
rEgEn	4	Regen

This parameter defines the drive operating mode. Pr xx.00 must be set to 1253 (European defaults) or 1254 (USA defaults) before this parameter can be changed. When the drive is reset to implement any change in this parameter, the default settings of all parameters will be set according to the drive operating mode selected and saved in memory.

## 6.2.9 Status information

0.4	9 {1	1.44}	Secur	ity stat	us					
R۱	N	Txt						PT	US	
<b>Û</b>			0 to	2		$\Diamond$		0		

This parameter controls access via the drive keypad as follows:

Value	String	Action
0	L1	Only menu 0 can be accessed
1	L2	All menus can be accessed
2	Loc	Lock user security when drive is reset. (This parameter is set to L1 after reset).

The keypad can adjust this parameter even when user security is set.

0.5	0 {1	0 (11.29) Software version							-	-	_
R	0	Uni						NC	PT		
$\hat{v}$		1.	1.00 to 99.99								

The parameter displays the software version of the drive.

0.51 {10.37} Action on trip detection									-		
R۱	N	Uni								US	
<b>Û</b>	0 to 15				$\Rightarrow$			0			

Each bit in this parameter has the following functions:

Bit	Function
0	Stop on non-important trips
1	Disable braking IGBT trips
2	Disable phase loss trip (Unidrive SP size 0 only)
3	Disable braking resistor temperature monitoring failure detection. (Unidrive SP size 0 only)

## Stop on non-important trips

If bit 0 is set to zero then the drive simply trips when a non-important trip occurs. Non-important trips are: th, ths, Old1, cL2, cL3, SCL. If bit 0 is set to one the drive will stop before tripping when one of these trips is initiated, except in Regen mode where the drive trips immediately.

## Disable braking IGBT trips

For details of braking IGBT trip mode see Pr 10.31.

Safety SMARTCARD Optimization Diagnostics information information installation Installation parameter the moto operation PLC parameters data information

## Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes

For information on tuning the drive for the best performance, see Chapter 8 Optimization .

Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.

The values of the motor parameters affect the protection of

The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr 0.46 Motor rated current. This affects the thermal protection of the motor.

If the keypad mode has been used previously, ensure that the keypad reference has been set to 0 using the buttons as if the drive is started using the keypad it will run to CAUTION the speed defined by the keypad reference (Pr 1.17).

If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.

#### 7.1 **Quick start Connections**

#### 7.1.1 **Basic requirements**

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.3 Quick Start commissioning/start-up on page 106.

Table 7-1 Minimum control connection requirements for each control mode

Drive control method	Requirements
Terminal mode	Drive Enable Speed reference Run forward or run reverse command
Keypad mode	Drive Enable
Serial communications	Drive Enable Serial communications link

Table 7-2 Minimum control connection requirements for each mode of operation

Operating mode	Requirements
Open loop mode	Induction motor
Closed loop vector - RFC mode	Induction motor
Closed loop vector mode	Induction motor with speed feedback
Closed loop servo mode	Permanent magnet motor with speed and position feedback

#### Speed feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z)
- Incremental encoder with forward and reverse outputs (F, R with or
- SINCOS encoder (with, or without Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder

## Speed and position feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z) with commutation signals (U, V, W)
- Incremental encoder with forward and reverse outputs (F. R with or without Z) and commutation outputs (U, V, W)
- SINCOS encoder (with Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder

For Solutions Module terminal information see section 11.15 Menus 15, 16 and 17: Solutions Module set-up on page 195 or the appropriate Solutions Module option user guide.

#### 7.2 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. (Pr 0.49 and Pr 0.34 are not affected by this procedure).

#### **Procedure**

Use the following procedure only if a different operating mode is required:

- 1. Enter either of the following values in Pr xx.00, as appropriate: 1253 (EUR, 50Hz AC supply frequency) 1254 (USA, 60Hz AC supply frequency)
- 2. Change the setting of Pr 0.48 as follows:

Pr 0.48 setting		Operating mode
048 0285 L2	1	Open-loop
0,48 EL UEEE	2	Closed-loop vector and RFC mode
0.48 587-00	3	Closed-loop Servo
048 F888n	4	Free Standing drives are not intended to be used in regen mode

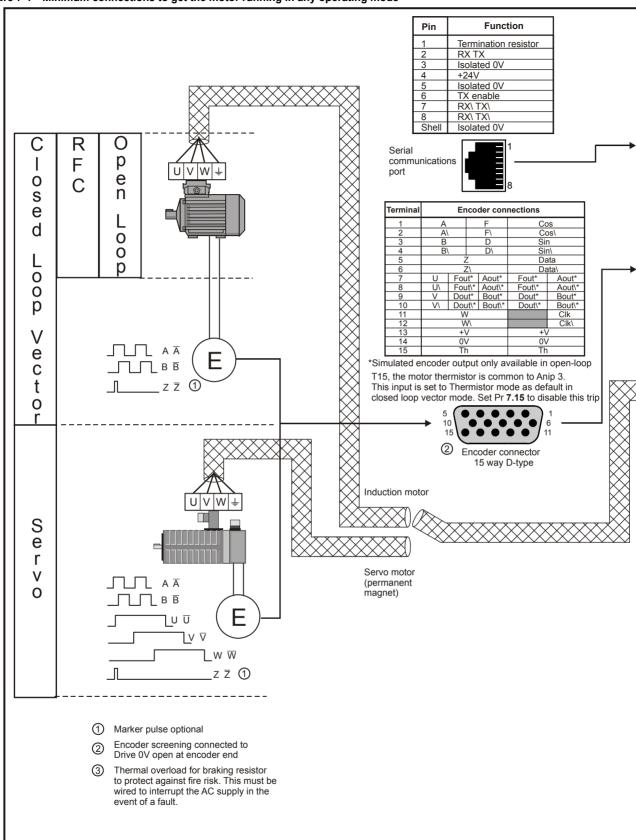

The figures in the second column apply when serial communications are used

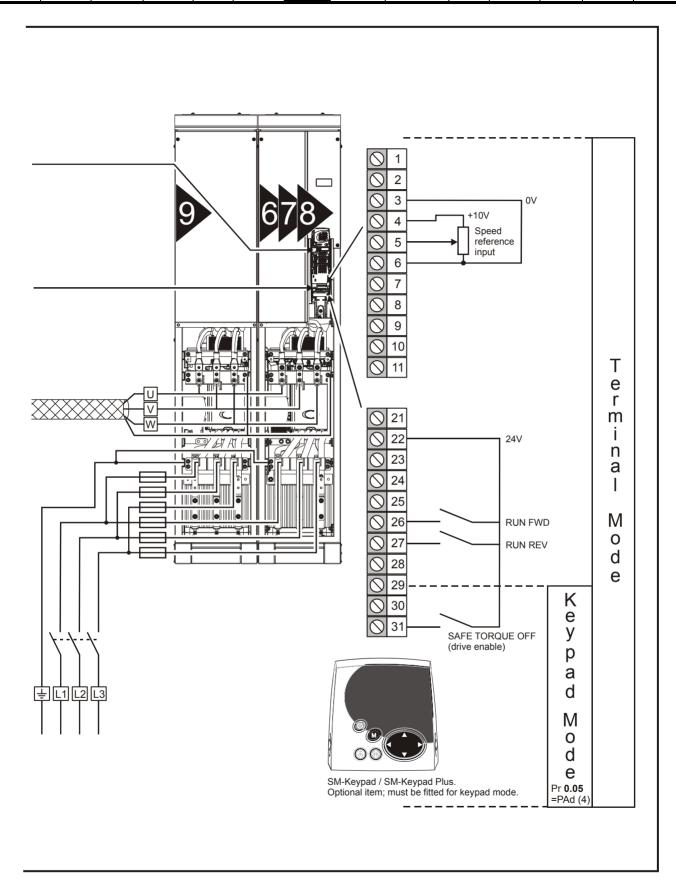

- Either:
- Press the red reset button
- Toggle the reset digital input
- Carry out a drive reset through serial communications by setting Pr 10.38 to 100 (ensure that Pr. xx.00 returns to 0).

## 7.3 Quick Start commissioning/start-up

## 7.3.1 Open loop

Action	Detail	
Before power-up	Ensure:     The drive enable signal is not given (terminal 31)     Run signal is not given     Motor is connected	X
Power-up the drive	Verify that Open Loop mode is displayed as the drive powers up. If the mode is incorrect see section section 7.2 Changing the operating mode on page 102.  If a motor thermistor is not connected and the drive trips on 'th' set Pr 0.21 = VOLt and press the red reset button.  Ensure:  • Drive displays 'inh'  If the drive trips, see Chapter 13 Diagnostics on page 254.	7
Enter motor nameplate details	Enter:  • Motor rated frequency in Pr 0.47 (Hz)  • Motor rated current in Pr 0.46 (A)  • Motor rated speed in Pr 0.45 (rpm)  • Motor rated voltage in Pr 0.44 (V) - check if 人 or △ connection	Mot X XXXXXXXXX kg  IPS5   c  c  F   C 40 s 51    V   1z   lmin   1W   cose   A    O 230   50   1445   220   0.80   8.50    CN = 14.5 km  A 240   50   1445   220   0.76   8.50    A 415   C
Set maximum frequency	Enter:  • Maximum frequency in Pr <b>0.02</b> (Hz)	0.02
Set acceleration / deceleration rates	<ul> <li>Enter:</li> <li>Acceleration rate in Pr 0.03 (s/100Hz)</li> <li>Deceleration rate in Pr 0.04 (s/100Hz) (If braking resistor installed, set Pr 0.15 = FAST. Also ensure Pr 10.30 and Pr 10.31 are set correctly, otherwise premature 'It.br' trips may be seen).</li> </ul>	100Hz
Autotune	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.  A rotating autotune will cause the motor to accelerate up to <sup>2</sup> / <sub>3</sub> base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference.  The drive can be stopped at any time by removing the run signal or removing the drive enable.  • A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune measures the stator resistance of the motor and the voltage offset in the drive. These are required for good performance in vector control modes. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 0.43.  • A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at <sup>2</sup> / <sub>3</sub> base speed in the direction selected. The rotating autotune measures the power factor of the motor.  To perform an autotune:  • Set Pr 0.40 = 1 for a stationary autotune or set Pr 0.40 = 2 for a rotating autotune  • Close the Drive Enable signal (terminal 31). The drive will display 'rdy'.  • Close the run signal (terminal 26 or 27). The lower display will flash 'Auto' and 'tunE' alternatively, while the drive is performing the autotune.  • Wait for the drive to display 'rdy' or 'inh' and for the motor to come to a standstill. If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 254. Remove the drive enable and run signal from the drive.	R <sub>s</sub> dL <sub>s</sub>
Save parameters	Press the red reset button or toggle the reset digital input (ensure Pr xx.00 returns to 0)	
Run	Drive is now ready to run

## 7.3.2 RFC mode

Software V01.10.00 or later should be used for RFC mode.

nduction moto Action	Detail	
Before power-up	Ensure:     Drive Enable signal is not given (terminal 31)     Run signal is not given     Motor and feedback device are connected	*
Power-up the drive	Verify that Closed Loop mode is displayed as the drive powers up. If the mode is incorrect see section section 7.2 Changing the operating mode on page 102.  If a motor thermistor is not connected and the drive trips on 'th' set Pr 0.21 = VOLt and press the red reset button.  Ensure:  Drive displays 'inh'  If the drive trips, see Chapter 13 Diagnostics on page 254.	7
Select RFC mode and disable encoder wire-break trip	<ul> <li>Set Pr 3.24 = 1 or 3 to select RFC mode</li> <li>Set Pr 3.40 = 0</li> </ul>	The state of the s
Enter motor nameplate details	Motor rated frequency in Pr 0.47 (Hz)     Motor rated current in Pr 0.46 (A)     Motor rated speed (base speed - slip speed) in Pr 0.45 (rpm)     Motor rated voltage in Pr 0.44 (V) - check if	Mark X0000000X 1g
Set maximum speed	Enter:  • Maximum speed in Pr 0.02 (rpm)	0.02
Set acceleration / deceleration rates	<ul> <li>Enter:</li> <li>Acceleration rate in Pr 0.03 (s/1000rpm)</li> <li>Deceleration rate in Pr 0.04 (s/1000rpm) (If braking resistor installed, set Pr 0.15 = FAST. Also ensure Pr 10.30 and Pr 10.31 are set correctly, otherwise premature 'It.br' trips may be seen).</li> </ul>	1000rpm
Select or deselect catch a spinning motor mode	If catch a spinning motor mode is not required then set Pr <b>6.09</b> to 0.  If catch a spinning motor mode is required then leave Pr <b>6.09</b> at the default of 1, but depending on the size of the motor the value in Pr <b>5.40</b> may need to be adjusted.  Pr <b>5.40</b> defines a scaling function used by the algorithm that detects the speed of the motor. The default value of Pr <b>5.40</b> is 1 which is suitable for small motors (<4kW). For larger motors the value in Pr <b>5.40</b> will need to be increased. Approximate values of Pr <b>5.40</b> for different motor sizes are as follows, 2 for 11kW, 3 for 55kW and 5 for 150kW. If the value of Pr <b>5.40</b> is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.	
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive.  NOTE  It is highly recommended that a rotating autotune is performed (Pr 0.40 set to 2).	
	A rotating autotune will cause the motor to accelerate up to $^2/_3$ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference.  The drive can be stopped at any time by removing the run signal or removing the drive enable.	cos Ø
Autotune	<ul> <li>A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. #### 7.3.4 Servo

Permanent magnet motor with a speed and position feedback device
For simplicity only an incremental quadrature encoder with commutation outputs will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.5 Setting up a feedback device on page 111.

Action	Detail	
ACTION	_ · · · · · · · · · · · · · · · · · · ·	T
Before power- up	<ul> <li>Run signal is not given</li> <li>Motor is connected</li> <li>Feedback device is connected</li> </ul>	X
Power-up the drive	Verify that Servo mode is displayed as the drive powers up. If the mode is incorrect see section 7.2 Changing the operating mode on page 102.  If a motor thermistor is not connected and the drive trips on 'th' set Pr 0.21 = VOLt and press the red reset button. Ensure:  • Drive displays 'inh'  If the drive trips, see Chapter 13 Diagnostics on page 254.	7
Set motor feedback parameters	Incremental encoder basic set-up Enter:  Drive encoder type in Pr. 3.38 = Ab.SErVO (3): Quadrature encoder with commutation outputs  Encoder power supply in Pr. 3.36 = 5V (0), 8V (1) or 15V (2).  NOTE  If output voltage from the encoder is >5V, then the termination resistors must be disabled Pr 3.39 to 0.  Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device.  Drive encoder Pulses Per Revolution in Pr. 3.34 (set according to encoder)  Drive encoder termination resistor setting in Pr. 3.39:  0 = A-A B-B Z-Z\ termination resistors disabled  1 = A-A B-B termination resistors enabled, Z-Z\ termination resistors disabled  2 = A-A B-B Z-Z\ termination resistors enabled	
Enter motor nameplate details	<ul> <li>Enter:         <ul> <li>Motor rated current in Pr 0.46 (A)</li> <li>Ensure that this equal to or less than the Heavy Duty rating of the drive otherwise It.AC trips may occur during the autotune.</li> </ul> </li> <li>Number of poles in Pr 0.42</li> </ul>	The Theory of the Control of the Con
Set maximum speed	Enter: • Maximum speed in Pr <b>0.02</b> (rpm)	0.02
Set acceleration / deceleration rates	<ul> <li>Enter:         <ul> <li>Acceleration rate in Pr 0.03 (s/1000rpm)</li> <li>Deceleration rate in Pr 0.04 (s/1000rpm) (If braking resistor installed, set Pr 0.15 = FAST. Also ensure Pr 10.30 and Pr 10.31 are set correctly, otherwise premature 'It.br' trips may be seen).</li> </ul> </li> </ul>	1500pm
Autotune	Unidrive SP is able to perform a short low speed, a normal low speed or a minimal movement autotune. The motor must be at a standstill before an autotune is enabled. A normal low speed autotune will measure the encoder phase offset angle and calculate the current gains.  The short low speed and normal low speed tests will rotate the motor by up to 2 revolutions in the direction selected, regardless of the reference provided. The minimal movement test will move the motor through an angle defined by Pr 5.38. Once complete the motor will come to a standstill. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the Drive Enable.  The motor must not be loaded when attempting an autotune.  The short low speed and normal low speed tests will rotate the motor by up to 2 rotations in the direction selected and the drive measures the encoder phase angle and updates the value in Pr 3.25. The normal low speed test also measures the stator resistance, and inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 0.38 and Pr 0.39 are updated. The short low speed test takes approximately 2s and the normal low speed test approximately 20s to complete.  The minimal movement autotune will move the motor through an angle defined by Pr 5.38. The motor must not be loaded for this test although it will operate correctly when the load is an inertia.  To perform an autotune:  Set Pr 0.40 = 1 for a short low speed autotune, Pr 0.40 = 2 for a normal low speed test or Pr 0.40 = 5 for a minimal movement autotune.  Close the Drive Enable signal (terminal 31). The lower display will flash 'Auto' and 'tunE' alternatively, while the drive is performing the test.  Wait for the drive to display 'rdy' or 'inh' and for the motor to come to a standstill.  If the drive trips it cannot be reset until the drive enable signal (terminal 31) has been removed. See Chapter 1

# 7.4 Quick start commissioning/start-up (CTSoft)

CTSoft is a Windows™ based software commissioning/start-up tool for Unidrive SP and other Control Techniques products.

CTSoft can be used for commissioning/start-up and monitoring, drive parameters can be uploaded, downloaded and compared, and simple or custom menu listings can be created. Drive menus can be displayed in standard list format or as live block diagrams. CTSoft is able to communicate with a single drive or a network.

CTSoft can be found on the CD which is supplied with the drive and is also available for download from www.controltechniques.com (file size approximately 25MB).

CTSoft system requirements:

- Windows 7, 2000/XP/Vista. Windows 95/98/98SE/ME/NT4 and Windows 2003 server are NOT supported
- Internet Explorer V5.0 or later must be installed
- Minimum of 800x600 screen resolution with 256 colors. 1024x768 is recommended.
- 256 MB RAM
- · Pentium IV 1000MHz or better recommended.
- · Adobe Acrobat Reader 5.1 or later (for parameter help). See CD provided
- Microsoft.Net Frameworks 2.0
- Note that you must have full administrator rights to install CTSoft.

To install CTSoft from the CD, insert the CD and the auto-run facility should start up the front-end screen from which CTSoft can be selected. Otherwise run the SETUP.exe in the CTSoft folder. Any previous copy of CTSoft should be uninstalled before proceeding with the installation (existing projects will not be lost).

Included with CTSoft are the user guides for the supported drive models. When help on a particular parameter is request by the user, CTSoft links to the parameter in the relevant advanced user guide.

### 7.5 Setting up a feedback device

This section shows the parameter settings which must be made to use each of the compatible encoder types with Unidrive SP. For more information on the parameters listed here please refer to the *Unidrive SP Advanced User Guide*.

#### 7.5.1 Overview

## 7.5.3 Restriction of encoder number of lines per revolution

Although Pr **3.34** can be set to any value from 0 to 50,000 there are restrictions on the values actually used by the drive. These restrictions are dependent on the software version as follows:

### Software version V01.06.01 and later

Table 7-4 Restrictions of drive encoder lines per revolution with software version V01.06.01 and later

Position feedback device	Equivalent Lines per revolution used by the drive
Ab, Fd, Fr, Ab.SErVO, Fd.SErVO, Fr.SerVO, SC	The drive uses the value in Pr 3.34.
SC.HiPEr, SC.EndAt, SC.SSI (rotary encoders)	If Pr 3.34 ≤1, the drive uses the value of 1.  If 1< Pr 3.34 <32,768, the drive uses the value in Pr 3.34 rounded down to nearest value that is a power of 2.  If Pr 3.34 ≥32,768, the drive uses the value of 32,768.
SC.HiPEr, SC.EndAt, SC.SSI (linear encoders	The drive uses the value in Pr 3.34.

#### Software version V01.06.00 and earlier

Table 7-5 Restrictions of drive encoder lines per revolution with software version V01.06.00 and earlier

Position feedback device	Equivalent Lines per revolution used by the drive
Ab, Fd, Fr	If Pr 3.34 <2, the drive uses the value of 2.  If 2≤ Pr 3.34 .≤16,384, the drive uses the value in Pr 3.34.  If Pr 3.34 >16,384, the drive uses the value in Pr 3.34 rounded down to nearest value divisible by 4.
Ab.SErVO, Fd.SErVO, Fr.SErVO	If Pr 3.34 ≤2, the drive uses the value of 2.  If 2< Pr 3.34 <16,384, the drive uses the value in Pr 3.34 rounded down to nearest value that is a power of 2.  If Pr 3.34 ≥16,384, the drive uses the value of 16,384.
SC, SC.HiPEr, SC.EndAt, SC.SSI	If Pr 3.34 ≤2, the drive uses the value of 2.  If 2< Pr 3.34 <32,768, the drive uses the value in Pr 3.34 rounded down to nearest value that is a power of 2.  If Pr 3.34 ≥32,768, the drive uses the value of 32,768.

At power-up Pr 3.48 is initially zero, but is set to one when the drive encoder and any encoders connected to any Solutions Modules have been initialized. The drive cannot be enabled until this parameter is one.

Encoder initialisation will occur as follows:

- At drive power-up
- · When requested by the user via Pr 3.47
- When trips PS.24V, Enc1 to Enc8, or Enc11 to Enc17 trips are reset
- The encoder number of lines per revolution (Pr **3.34**) or the number of motor poles (Pr **5.11** and Pr **21.11**) are changed (software version V01.08.00 and later).

Initialization causes an encoder with communications to be re-initialized and auto-configuration to be performed if selected. After initial is at ion Ab.SErVO, Fd.SErVO and Fr.SErVO encoders will use the UVW commutations signals to give position feedback for the first 120° (electrical) of rotation when the motor is restarted.

# 8 Optimization

This chapter takes the user through methods of optimizing the product set-up, maximizing performance. The auto-tuning features of the drive simplify this task.

# 8.1 Motor map parameters

#### 8.1.1 Open loop motor control

#### Pr 0.46 {5.07} Motor rated current

#### Defines the maximum continuous motor current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 Maximum motor rated current on page 125, for information about setting this parameter higher then the maximum Heavy Duty current rating). The motor rated current is used in the following:

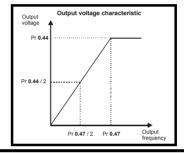

- Current limits (see section 8.3 *Current limits* on page 125, for more information)
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 125, for more information)
- Vector mode voltage control (see Voltage mode Pr 0.07, later in this table)
- Slip compensation (see Slip compensation Pr 5.27, later in this table)
- · Dynamic V/F control

Pr 0.44 {5.09} Motor rated voltage

Pr 0.47 {5.06} Motor rated frequency

Defines the voltage applied to the motor at rated frequency
Defines the frequency at which rated voltage is applied

The motor rated voltage Pr **0.44** and the motor rated frequency Pr **0.47** are used to define the voltage to frequency characteristic applied to the motor (see voltage mode Pr **0.07**, later in this table). The motor rated frequency is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see motor rated speed Pr **0.45**, later in this table).

Pr 0.45 {5.08} Motor rated speed

Pr 0.42 {5.11} Motor number of poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and the number of poles are used with the motor rated frequency to calculate the rated slip of induction machines in Hz.

Rated slip (Hz) = Motor rated frequency - (Number of pole pairs x [Motor rated speed / 60]) =  $0.47 - \left(\frac{0.42}{2} \times \frac{0.45}{60}\right)$ 

If Pr **0.45** is set to 0 or to synchronous speed, slip compensation is disabled. If slip compensation is required this parameter should be set to the nameplate value, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field-weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

Pr **0.42** is also used in the calculation of the motor speed display by the drive for a given output frequency. When Pr **0.42** is set to 'Auto', the number of motor poles is automatically calculated from the rated frequency Pr **0.47**, and the motor rated speed Pr **0.45**.

Number of poles = 120 x (Motor rated frequency Pr 0.47 / Motor rated speed Pr 0.45) rounded to the nearest even number

#### Pr 0.43 {5.10} Motor rated power factor

#### Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. The power factor is used in conjunction with the motor rated current Pr **0.46**, to calculate the rated active current and magnetising current of the motor. The rated active current is used extensively to control the drive, and the magnetising current is used in vector mode stator resistance compensation. It is important that this parameter is set up correctly. The drive can measure the motor rated power factor by performing a rotating autotune (see Autotune Pr **0.40**, below).

#### Pr 0.40 {5.12} Autotune

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test
  measures the stator resistance (Pr 5.17) and voltage offset (Pr 5.23), which are required for good performance in vector control modes (see
  Voltage mode Pr 0.07, later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor
  nameplate must be entered into Pr 0.43. To perform a Stationary autotune, set Pr 0.40 to 1, and provide the drive with both an enable signal (on
  terminal 31) and a run signal (on terminal 26 or 27).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, before rotating the motor at  $^{2}/_{3}$  base speed in the direction selected for several seconds (regardless of the speed reference). In addition to the stator resistance (Pr **5.17**) and voltage offset (Pr **5.23**), the rotating autotune measures the power factor of the motor and updates Pr **0.43** with the correct value. To perform a Rotating autotune, set Pr **0.40** to 2, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

Safety Product Mechanical Electrical Getting Basic Running information installation Installation

#### Pr 0.07 {5.14} Voltage mode

There are six voltage modes available which fall into two categories, vector control and fixed boost.

#### Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0Hz to motor rated frequency (Pr 0.47), and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the motor rated power factor (Pr 0.43), stator resistance (Pr 5.17) and voltage offset (Pr 5.23) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr 0.40 Autotune). The drive can also be made to measure the stator resistance and voltage offset automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

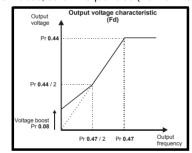

- (0) **Ur\_S** = The stator resistance and the voltage offset are measured and the parameters for the selected motor map are over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur\_s mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new values of stator resistance and voltage offset are not automatically saved to the drive's EEPROM.
- (4) **Ur\_I** = The stator resistance and voltage offset are measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new values of stator resistance and voltage offset are not automatically saved to the drive's EEPROM.
- (1) **Ur** = The stator resistance and voltage offset are not measured. The user can enter the motor and cabling resistance into the stator resistance parameter (Pr **5.17**). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance and voltage offset.
- (3) **Ur\_Auto=** The stator resistance and voltage offset are measured once, the first time the drive is made to run. After the test has been completed successfully the voltage mode (Pr **0.07**) is changed to Ur mode. The stator resistance (Pr **5.17**) and voltage offset (Pr **5.23**) parameters are written to, and along with the voltage mode (Pr **0.07**), are saved in the drive's EEPROM. If the test fails, the voltage mode will stay set to Ur\_Auto and the test will be repeated next time the drive is made to run.

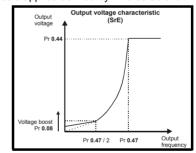

#### Fixed boost

Neither the stator resistance nor the voltage offset are used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by parameter Pr 0.08, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are two settings of fixed boost available:

- (2) **Fd** = This mode provides the motor with a linear voltage characteristic from 0Hz to rated frequency (Pr **0.47**), and then a constant voltage above rated frequency.
- (5) **SrE** = This mode provides the motor with a square law voltage characteristic from 0Hz to rated frequency (Pr **0.47**), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.

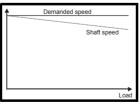

For both these modes, at low frequencies (from 0Hz to ½ x Pr 0.47) a voltage boost is applied defined by Pr 0.08 as shown below:

#### Pr 5.27 Slip compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled.

To enable slip compensation Pr **5.27** must be set to a 1 (this is the default setting), and the motor rated speed must be entered in Pr **0.45** (Pr **5.08**). The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5kW, 50Hz, 4 pole motor, the motor rated speed would be approximately 1465rpm. The synchronous speed for a 50Hz, 4 pole motor is 1500rpm, so therefore the slip speed would be 35rpm.

If the synchronous speed is entered in Pr **0.45**, slip compensation will be disabled. If too small a value is entered in Pr **0.45**, the motor will run faster than the demanded frequency.

The synchronous speeds for 50Hz motors with different numbers of poles are as follows:

2 pole = 3000rpm, 4 pole = 1500rpm, 6pole =1000rpm, 8 pole = 750rpm

informatio	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

#### 8.1.2 RFC mode

Software V01.10.00 or later should be used for RFC mode.

#### Pr 0.46 {5.07} Motor rated current

#### Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 *Maximum motor rated current* on page 125, for information about setting this parameter higher than the maximum Heavy Duty current rating). The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 125, for more information)
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 125, for more information)
- Vector control algorithm

#### Pr 0.44 {5.09} Motor rated voltage

#### Pr 0.47 {5.06} Motor rated frequency

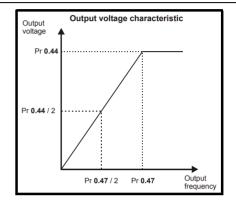

The motor rated voltage Pr **0.44** and the motor rated frequency Pr **0.47** are used to define the relationship between the voltage and frequency applied to the motor, as shown.

The motor rated voltage is used by the field controller to limit the voltage applied to the motor. Normally this is set to the nameplate value. To allow current control to be maintained, it is necessary for the drive to leave some 'headroom' between the motor terminal voltage and the maximum available drive output voltage. For good transient performance at high speed, the motor rated voltage should be set below 95% of the minimum supply voltage to the drive.

The motor rated voltage and motor rated frequency are also used during the rotating autotune test (see Autotune Pr **0.40** later in this table) and in the calculations required for automatic optimization of the motor rated speed (see Motor rated speed optimization Pr **5.16**, later in this table). Therefore, it is important that the correct value for motor rated voltage is used

Defines the voltage applied to the motor at rated frequency

Defines the frequency at which rated voltage is applied

#### Pr 0.45 {5.08} Motor rated speed

#### Pr 0.42 {5.11} Motor number of poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- · Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- · Reduced transient performance
- Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see Motor rated speed autotune Pr **5.16**, later in this table).

When Pr **0.42** is set to 'Auto', the number of motor poles is automatically calculated from the motor rated frequency Pr **0.47**, and the motor rated speed Pr **0.45** 

Number of poles = 120 x (Motor rated frequency Pr 0.47 / Motor rated speed Pr 0.45) rounded to the nearest even number

#### Pr 0.43 {5.10} Motor rated power factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the stator inductance is set to zero (Pr **5.25**) then the power factor is used in conjunction with the motor rated current Pr **0.46** and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see Autotune Pr **0.40**, later in this table).

Safety | Product information | Product infor

#### Pr 0.40 {5.12} Autotune

There are three autotune tests available in RFC mode, a stationary test, a rotating test and an inertia measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

#### NOTE

It is highly recommended that a rotating autotune is performed (Pr 0.40 set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the stator resistance (Pr **5.17**) and transient inductance (Pr **5.24**) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr **4.13** and Pr **4.14** are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr **0.43**. To perform a Stationary autotune, set Pr **0.40** to 1, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune before rotating the motor at <sup>2</sup>/<sub>3</sub> of motor rated frequency in the direction selected for approximately 30s. During the rotating autotune the stator inductance (Pr 5.25), and the motor saturation breakpoints (Pr 5.29 and Pr 5.30) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr 0.40 to 2, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see *Speed loop gains*) and to provide torque feed-forwards when required during acceleration.

  During the inertia measurement test the drive attempts to accelerate the motor in the direction selected up to  ${}^{3}/_{4}$  x rated load rpm and then back to standstill. The drive uses rated torque/16, but if the motor cannot be accelerated to the required speed the drive then increases the torque progressively to  $x^{1}/_{8}$ ,  $x^{1}/_{4}$ ,  $x^{1}/_{2}$  and x1 rated torque. If the required speed is not achieved on the final attempt the test is aborted and a tunE1 trip is initiated. If the test is successful the acceleration and deceleration times are used to calculate the motor and load inertia which is then written to Pr 3.18. The motor map parameters must be set up correctly including the power factor before performing an inertia measurement test. To perform an Inertia measurement autotune, set Pr 0.40 to 3, and provide the drive with both an enable signal (on terminal 31) and a run signal

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

#### Pr 0.38 {4.13} / Pr 0.39 {4.14} Current loop gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by one of the following:

- During a stationary or rotating autotune (see *Autotune Pr 0.40*, earlier in this table) the drive measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor and calculates the current loop gains.
- By setting Pr **0.40** to 4 the drive will calculate the current loop gains from the values of stator resistance (Pr **5.17**) and transient inductance (Pr **5.24**) set in the drive.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5% overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed RFC induction motor applications) the integral gain may need to have a significantly higher value.

#### Pr 3.42 Drive encoder filter

In RFC mode Pr 3.42 defines a filter on the output of the speed estimator which is used as the speed feedback. A filter with a 4ms time constant is always present on the output of the speed estimator, but this filter may be extended as follows:

0 = 4ms, 1 = 8ms, 2 = 16ms, 3 = 32ms, 4 = 64ms, 5 = 128ms.

The output of the speed estimator can include some ripple, which increases as the drive passes into field weakening and the filter can be used to remove this ripple. This is particularly useful when using standard ramp or spinning start with a low friction, high inertia load, and can prevent over voltage trips when the drive has no braking resistor.

#### Pr 5.40 Spin start boost

If Pr **6.09** is set to enable the catch a spinning motor function in open-loop mode or RFC modes, this parameter defines a scaling function used by the algorithm that detects the speed of the motor. It is likely that for smaller motors (~4kW) the default value of 1.0 is suitable, but for larger motors this parameter may need to be increased. If the value of this parameter is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.

Safety Product Mechanical Electrical Getting Basic reformation information information information information information information information information installation in

#### Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 3.16. If Pr 3.16 = 0, gains Kp1, Ki1 and Kd1 (Pr 0.07 to Pr 0.09) are used, and if Pr 3.16 = 1, gains Kp2, Ki2 and Kd2 (Pr 3.13 to Pr 3.15) are used. Pr 3.16 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 3.17.

#### Proportional gain (Kp), Pr 0.07 (3.10) and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

#### Integral gain (Ki), Pr 0.08 (3.11) and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC mode, it is unlikely that the integral gain can be increased much above 0.50.

#### Differential gain (Kd), Pr 0.09 (3.12) and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

#### 1. Pr 3.17 = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

#### 2. Pr 3.17 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr **3.20** - Required bandwidth,

Pr 3.21 - Required damping factor,

Pr 3.18 - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table).

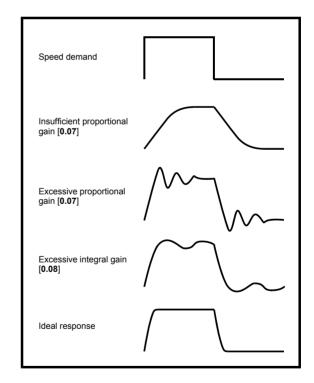

#### 3. Pr 3.17 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.19 - Required compliance angle,

Pr 3.21 - Required damping factor,

Pr 3.18 - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table).

#### 8.1.3 Closed loop vector motor control

#### Pr 0.46 {5.07} Motor rated current

#### Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 *Maximum motor rated current* on page 125, for information about setting this parameter higher than the maximum Heavy Duty current rating). The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 125, for more information)
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 125, for more information)
- · Vector control algorithm

#### Pr 0.44 {5.09} Motor rated voltage

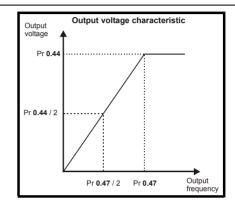

# Pr 0.47 {5.06} Motor rated frequency

The motor rated voltage Pr **0.44** and the motor rated frequency Pr **0.47** are used to define the relationship between the voltage and frequency applied to the motor, as shown.

The motor rated voltage is used by the field controller to limit the voltage applied to the motor. Normally this is set to the nameplate value. To allow current control to be maintained, it is necessary for the drive to leave some 'headroom' between the motor terminal voltage and the maximum available drive output voltage. For good transient performance at high speed, the motor rated voltage should be set below 95% of the minimum supply voltage to the drive.

The motor rated voltage and motor rated frequency are also used during the rotating autotune test (see Autotune Pr **0.40** later in this table) and in the calculations required for automatic optimization of the motor rated speed (see Motor rated speed optimization Pr **5.16**, later in this table). Therefore, it is important that the correct value for motor rated voltage is

Defines the voltage applied to the motor at rated frequency
Defines the frequency at which rated voltage is applied

#### Pr 0.45 {5.08} Motor rated speed

#### Pr 0.42 {5.11} Motor number of poles

Defines the full load rated speed of the motor

Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- Reduced efficiency of motor operation
- · Reduction of maximum torque available from the motor
- · Reduced transient performance
- Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see Motor rated speed autotune Pr **5.16**, later in this table).

When Pr **0.42** is set to 'Auto', the number of motor poles is automatically calculated from the motor rated frequency Pr **0.47**, and the motor rated speed Pr **0.45** 

Number of poles = 120 x (Motor rated frequency Pr 0.47 / Motor rated speed Pr 0.45) rounded to the nearest even number

#### Pr 0.43 {5.10} Motor rated power factor

#### Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the stator inductance is set to zero (Pr **5.25**) then the power factor is used in conjunction with the motor rated current Pr **0.46** and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see Autotune Pr **0.40**, later in this table).

#### Pr 0.40 {5.12} Autotune

There are three autotune tests available in closed loop vector mode, a stationary test, a rotating test and an inertia measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 4.13 and Pr 4.14 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 0.43. To perform a Stationary autotune, set Pr 0.40 to 1, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune before rotating the motor at <sup>2</sup>/<sub>3</sub> of motor rated frequency in the direction selected for approximately 30s. During the rotating autotune the stator inductance (Pr **5.25**), and the motor saturation breakpoints (Pr **5.29** and Pr **5.30**) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr **0.40** to 2, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see *Speed loop gains*) and to provide torque feed-forwards when required during acceleration.

  During the inertia measurement test the drive attempts to accelerate the motor in the direction selected up to  ${}^{3}l_{4}$  x rated load rpm and then back to standstill. The drive uses rated torque/16, but if the motor cannot be accelerated to the required speed the drive then increases the torque progressively to  $x^{1}l_{8}$ ,  $x^{1}l_{4}$ ,  $x^{1}l_{2}$  and x1 rated torque. If the required speed is not achieved on the final attempt the test is aborted and a tunE1 trip is initiated. If the test is successful the acceleration and deceleration times are used to calculate the motor and load inertia which is then written to Pr 3.18. The motor map parameters must be set up correctly including the power factor before performing an inertia measurement test. To perform an Inertia measurement autotune, set Pr 0.40 to 3, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

#### Pr 5.16 Motor rated speed autotune

The motor rated speed parameter (Pr **0.45**) in conjunction with the motor rated frequency parameter (Pr **0.47**) defines the full load slip of the motor. The slip is used in the motor model for closed-loop vector control. The full load slip of the motor varies with rotor resistance which can vary significantly with motor temperature. When Pr **5.16** is set to 1 or 2 the drive can automatically sense if the value of slip defined by Pr **0.47** and Pr **0.45** has been set incorrectly or if it has varied with motor temperature. If the value is incorrect Pr **0.45** is automatically adjusted. Pr **0.45** is not saved at power-down, and so when the drive is powered-down and up again it will return to the last saved value. If the new value is required at the next power-up it must be saved by the user. Automatic optimization is only enabled when the speed is above rated speed/8, and when the load on the motor load rises above  $\frac{5}{8}$  rated load. Optimization is disabled again if the load falls below  $\frac{1}{2}$  rated load. For best optimization results the correct values of stator resistance (Pr **5.17**), transient inductance (Pr **5.24**), stator inductance (Pr **5.25**) and saturation breakpoints (Pr **5.29**, Pr **5.30**) should be stored in the relevant parameters (all these can be measured by the drive by performing a rotating autotune). Motor rated speed autotune is not available if the drive is not using external position/speed feedback.

The gain of the optimizer, and hence the speed with which it converges, can be set at a normal low level when Pr **5.16** is set to 1. If this parameter is set to 2, the gain is increased by a factor of 16 to give faster convergence.

#### Pr 0.38 {4.13} / Pr 0.39 {4.14} Current loop gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by one of the following:

- During a stationary or rotating autotune (see Autotune Pr 0.40, earlier in this table) the drive measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor and calculates the current loop gains.
- By setting Pr **0.40** to 4 the drive will calculate the current loop gains from the values of stator resistance (Pr **5.17**) and transient inductance (Pr **5.24**) set in the drive.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5% overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed closed-loop induction motor applications) the integral gain may need to have a significantly higher value.

Safety Product Mechanical Electrical Getting Installation Installation

#### Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 3.16. If Pr 3.16 = 0, gains Kp1, Ki1 and Kd1 (Pr 0.07 to Pr 0.09) are used, and if Pr 3.16 = 1, gains Kp2, Ki2 and Kd2 (Pr 3.13 to Pr 3.15) are used. Pr 3.16 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 3.17.

#### Proportional gain (Kp), Pr 0.07 (3.10) and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the closed-loop stability limit is reached.

#### Integral gain (Ki), Pr 0.08 (3.11) and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

#### Differential gain (Kd), Pr 0.09 (3.12) and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

#### 1. Pr **3.17** = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

#### 2. Pr 3.17 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.20 - Required bandwidth,

Pr 3.21 - Required damping factor,

Pr 3.18 - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table).

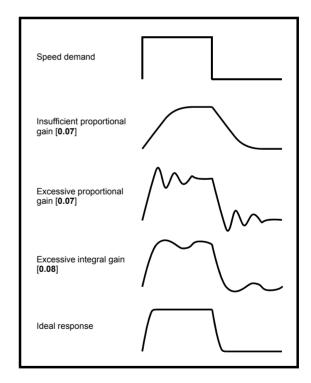

#### 3. Pr 3.17 = 2, Compliance angle set-up

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.19 - Required compliance angle,

Pr 3.21 - Required damping factor,

Pr 3.18 - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table).

#### 8.1.4 Servo motor control

#### Pr 0.46 {5.07} Motor rated current

#### Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 125, for more information)
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 125, for more information)

#### Pr 0.42 {5.11} Motor number of poles

#### Defines the number of motor poles

The motor number of poles parameter defines the number of electrical revolutions in one whole mechanical revolution of the motor. This parameter must be set correctly for the control algorithms to operate correctly. When Pr **0.42** is set to "Auto" the number of poles is 6.

#### Pr 0.40 {5.12} Autotune

There are five autotune tests available in servo mode, a short low speed test, a normal low speed test, an inertia measurement test, a stationary test to set up current controller gains and a minimal movement phasing test. A normal low speed should be done where possible as the drive measures the stator resistance and inductance of the motor, and from these calculates the current loop gains. An inertia measurement test should be performed separately to a short low speed or normal low speed autotune.

- A short low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the direction selected. The drive applies rated current to the motor during the test and measures the encoder phase angle (Pr 3.25). The phase angle measurement is taken when the motor has stopped at the end of the test, therefore there must be no load on the motor when it is at rest for the correct angle to be measured. This test takes approximately 2 seconds to complete and can only be used where the rotor settles to a stable position in a short time. To perform a short low speed autotune, set Pr 0.40 to 1, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- A normal low speed test will rotate the motor by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the direction selected. The drive applies rated current to the motor during the test and measures the encoder phase angle (Pr 3.25). The phase angle measurement is taken when the motor has stopped at the end of the test, therefore there must be no load on the motor when it is at rest for the correct angle to be measured. The motor resistance (Pr 5.17) and inductance (Pr 5.24) are then measured, and the values are used to set up the current loop gains (Pr 0.38 {4.13} and Pr 0.39 {4.14}). The whole test takes approximately 20 seconds and can be used with motors that take time to settle after the rotor has moved. During the motor inductance measurement the drive applies current pulses to the motor that produces flux that opposes the flux produced by the magnets. The maximum current applied is a quarter of rated current (Pr 0.46). This current is unlikely to affect the motor magnets, however, if this level of current could permanently de-magnetise the magnets the rated current should be set to a lower level for the tests to avoid this. To perform a normal low speed autotune, set Pr 0.40 to 2, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

- The inertia measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains) and to provide torque feed-forwards when required during acceleration.
  - During the inertia measurement test the drive attempts to accelerate the motor in the direction selected up to  $^{3}$ / $_{4}$  x rated load rpm and then back to standstill. The drive uses rated torque/16, but if the motor cannot be accelerated to the required speed the drive then increases the torque progressively to  $x^{1}$ / $_{8}$ ,  $x^{1}$ / $_{4}$ ,  $x^{1}$ / $_{2}$  and x1 rated torque. If the required speed is not achieved on the final attempt the test is aborted and a tunE1 trip is initiated. If the test is successful the acceleration and deceleration times are used to calculate the motor and load inertia which is then written to Pr **3.18**. The value of the value of motor torque per amp in Pr **5.32** and the motor rated speed in Pr **5.08** must be set up correctly before performing an inertia measurement test. To perform an Inertia measurement autotune, set Pr **0.40** to 3, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- The stationary test to set up current controller gains measures the stator resistance and the transient inductance of the motor, calculates the current loop gains and updates the current loop gain parameters. This test does not measure the encoder phase angle. This test should only be performed when the correct phasing angle has been set in Pr 0.43. If the phasing angle is not correct the motor may move and the results may be incorrect. To perform a stationary test to set up current controller gains, set Pr 0.40 to 4, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).
- A minimal movement phasing test can measure the encoder phase offset by moving the motor through a small angle. Short current pulses are applied to the motor to produce a small movement and then to move the motor back to the original position. The size and length of the pulses are gradually increased (up to a maximum of motor rated current) until the movement is approximately at the level defined by Pr 5.38 electrical degrees. The resulting movements are used to estimate the phase angle. To perform a minimal movement phasing test, set Pr 0.40 to 5, and provide the drive with both an enable signal (on terminal 31) and a run signal (on terminal 26 or 27).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the SAFE TORQUE OFF signal from terminal 31, setting the drive enable parameter Pr 6.15 to OFF (0) or disabling the drive via the control word (Pr 6.42 & Pr 6.43).

#### Current loop gains (Pr 0.38 {4.13} / Pr 0.39 {4.14})

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by one of the following:

- During a stationary or rotating autotune (see Autotune Pr 0.40, earlier in this table) the drive measures the stator resistance (Pr 5.17) and transient inductance (Pr 5.24) of the motor and calculates the current loop gains.
- By setting Pr **0.40** to 6 the drive will calculate the current loop gains from the values of stator resistance (Pr **5.17**) and transient inductance (Pr **5.24**) set in the drive.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5% overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed closed-loop induction motor applications) the integral gain may need to have a significantly higher value.

Safety Product Mechanical Electrical Getting Installation Installation

#### Speed loop gains (Pr 0.07 {3.10}, Pr 0.08 {3.11}, Pr 0.09 {3.12})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 3.16. If Pr 3.16 = 0, gains Kp1, Ki1 and Kd1 (Pr 0.07 to Pr 0.09) are used, and if Pr 3.16 = 1, gains Kp2, Ki2 and Kd2 (Pr 3.13 to Pr 3.15) are used. Pr 3.16 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 3.17.

#### Proportional gain (Kp), Pr 0.07 (3.10) and Pr 3.13

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the closed-loop stability limit is reached.

### Integral gain (Ki), Pr 0.08 (3.11) and Pr 3.14

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

#### Differential gain (Kd), Pr 0.09 (3.12) and Pr 3.15

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are three methods of tuning the speed loop gains dependant on the setting of Pr 3.17:

#### 1. Pr **3.17** = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

#### 2. Pr 3.17 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.20 - Required bandwidth,

Pr 3.21 - Required damping factor,

Pr 5.32 - Motor torque per amp (Kt).

Pr **3.18** - Motor and load inertia. The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr **0.40**, earlier in this table).

#### 3. Pr 3.17 = 2, Compliance angle set-up

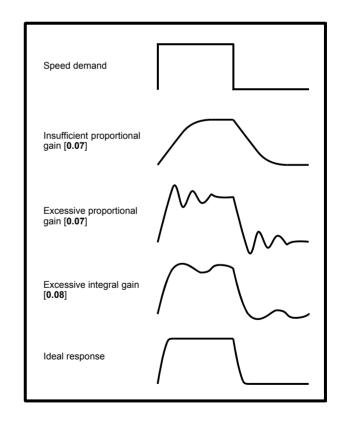

If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

Pr 3.19 - Required compliance angle,

Pr 3.21 - Required damping factor,

Pr 5.32 - Motor torque per amp (Kt).

Pr 3.18 - Motor and load inertia The drive can be made to measure the motor and load inertia by performing an inertia measurement autotune (see Autotune Pr 0.40, earlier in this table).

Safety Mechanical Electrical **UL** Listing Optimization Diagnostics information parameters operation information installation Installation started the motor PLC parameters information

#### 8.2 Maximum motor rated current

The maximum motor rated current allowed by the drive is greater than the maximum Heavy Duty current rating in Pr **11.32**. The ratio between the Normal Duty rating and the Heavy Duty rating (Pr **11.32**) varies between drive sizes. The values for the Normal and Heavy Duty rating can be found in section 2.2 *Ratings* on page 11.

If the motor rated current (Pr **0.46**) is set above the maximum Heavy Duty current rating (Pr **11.32**), the current limits and the motor thermal protection scheme are modified (see *section 8.3 Current limits* and *section 8.4 Motor thermal protection*, for more information).

### 8.3 Current limits

The default settings for the current limit parameters for Unidrive SP size 6 to 9 are:

- 138.1% x motor rated current for open loop mode
- 165.7% x motor rated current for closed loop vector mode
- 150% x motor rated current for servo mode

There are three parameters which control the current limits:

- Motoring current limit: power flowing from the drive to the motor
- · Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen operation

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

Increasing the motor rated current (Pr **0.46/5.07**) above the Heavy Duty rating (default value), will automatically reduce the current limits in Pr **4.05** to Pr **4.07**. If the motor rated current is then set to or below the Heavy Duty rating, the current limits will be left at their reduced values.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000%.

# 8.4 Motor thermal protection

The drive models the temperature of the motor using the motor rated current (Pr **5.07**), the thermal time constant (Pr **4.15**), whether low speed thermal protection mode has been enabled (Pr **4.25**) and the actual current flowing at any point in time. Pr **4.19** gives the estimated motor temperature as a percentage of maximum temperature.

The temperature of the motor (Pr **4.19**) as a percentage of maximum temperature, with a constant current magnitude of I, constant value of K and constant value of Motor rated current (Pr **5.07**) after time t is given by:

Percentage motor temperature (Pr 4.19)

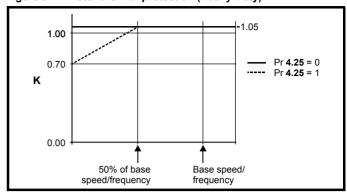

= [I<sup>2</sup> / (K x Motor rated current)<sup>2</sup>] (1 - 
$$e^{-t/\tau}$$
) x 100%

This assumes that the maximum allowed motor temperature is produced by K x Motor rated current and that  $\tau$  is the thermal time constant of the point in the motor that reaches its maximum allowed temperature first.  $\tau$  is defined by Pr **4.15**. If Pr **4.15** has a value between 0.0 and 1.0 the thermal time constant is taken as 1.0.

The value of K is defined as shown in Figure 8-1 and Figure 8-2.

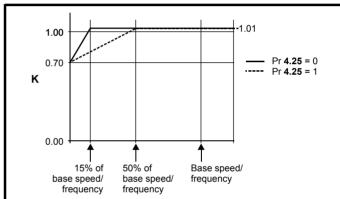

For both Heavy and Normal duty ratings, Pr **4.25** can be used to select two alternative protection characteristics.

Figure 8-1 Motor thermal protection (Heavy Duty)

If Pr **4.25** is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr **4.25** is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50% of base speed/ frequency. The maximum value for K is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105% current

Figure 8-2 Motor thermal protection (Normal Duty)

Both settings of Pr **4.25** are intended for motors where the cooling effect of the motor fan reduces with reduced motor speed, but with different speeds below which the cooling effect is reduced. If Pr **4.25** is 0 the characteristic is intended for motors where the cooling effect reduces with motor speed below 15% of base speed/frequency. If Pr **4.25** is 1 the characteristic is intended for motors where the cooling effect reduces with motor speed below 50% of base speed/frequency. The maximum value for K is 1.01, so that above the knee of the characteristics the motor can operate continuously up to 101% current.

When the estimated temperature in Pr **4.19** reaches 100% the drive takes some action depending on the setting of Pr **4.16**. If Pr **4.16** is 0, the drive trips when Pr **4.19** reaches 100%. If Pr **4.16** is 1, the current limit is reduced to  $(K - 0.05) \times 100\%$  when Pr **4.19** reaches 100%. The current limit is set back to the user defined level when Pr **4.19** falls below 95%. The thermal model temperature accumulator is reset to zero at power-up and accumulates the temperature of the motor while the drive remains powered-up. If the rated current defined by Pr **5.07** is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr **4.15**) is 89s for an induction motor (open loop and closed loop vector), which is equivalent to an overload of 150% for 60s from cold. The default value for a servo motor is 20s, which is equivalent to an overload of 175% for 9s from cold.

The time for the drive to trip from cold with constant motor current is given by:

$$T_{trip} = -(Pr 4.15) \times In(1 - (K \times Pr 5.07 / Pr 4.01)^2)$$

Alternatively the thermal time constant can be calculated from the trip time with a given current from:

$$Pr 4.15 = -T_{trip} / In(1 - (K / Overload)^2)$$

The maximum value for the thermal time constant can be increased up to a maximum value of 3000s to allow an increased overload if the motor thermal characteristics permit.

For applications using CT Dynamics Unimotors the thermal time constants can be found in the Unimotor manual.

### 8.5 Switching frequency

The default switching frequency is 3kHz (6kHz in Servo mode), however this can be increased up to a maximum of 6kHz by Pr **5.18**. The available switching frequencies are shown below.

Table 8-1 Available switching frequencies

Drive size	Voltage rating	3kHz	4kHz	6kHz
6	All	<b>√</b>	<b>√</b>	<b>✓</b>
7	All	<b>√</b>	✓	<b>√</b>
8	All	✓	✓	<b>√</b>
9	All	✓	✓	✓

If switching frequency is increased from 3kHz the following apply:

- Increased heat loss in the drive, which means that derating to the output current must be applied.
   See the derating tables for switching frequency and ambient temperature in section 12.1.1 Power and current ratings (Derating for switching frequency and temperature) on page 243.
- Reduced heating of the motor due to improved output waveform quality.
- 3. Reduced acoustic noise generated by the motor.
- Increased sample rate on the speed and current controllers. A trade
  off must be made between motor heating, drive heating and the
  demands of the application with respect to the sample time required.

Table 8-2 Sample rates for various control tasks at each switching frequency

	3, 6kHz	4kHz	Open loop	Closed loop vector and Servo
Level 1	3kHz = 167μs 6kHz = 83μs 12kHz = 83μs	125µs	Peak limit	Current controllers
Level 2	250μs		Current limit and ramps	Speed controller and ramps
Level 3	1ms		Voltage	controller
Level 4	4ms		Time critica	I user interface
Background			Non-time criti	cal user interface

# 8.6 High speed operation

#### 8.6.1 Encoder feedback limits

The maximum encoder frequency should be prevented from exceeding 500kHz (or 410kHz for software V01.06.00 and earlier). In closed loop and servo modes the maximum speed that can be entered in to the speed reference clamps (Pr **1.06** and Pr **1.07**) can be limited by the drive. This is defined by the following (subject to an absolute maximum of 40,000rpm):

Maximum speed limit (rpm) = 
$$\frac{500\text{kHz} \times 60}{\text{ELPR}}$$
$$= \frac{3.0 \times 10^7}{\text{ELPR}}$$

Where:

ELPR is the equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.

Quadrature encoder ELPR = number of lines per revolution

- F and D encoder ELPR = number of lines per revolution / 2
- SINCOS encoder ELPR = number of sine waves per revolution

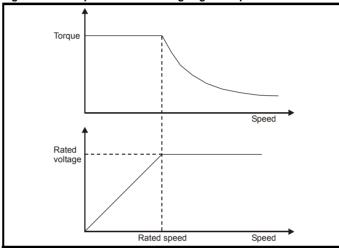

This maximum speed limit is defined by the device selected with the speed feedback selector (Pr **3.26**), and the ELPR set for the position feedback device. In closed-loop vector mode it is possible to disable this limit via Pr **3.24**, so that the drive can be switched between operation with and without feedback when the speed becomes too high for the feedback device. The maximum speed limit is defined as above when Pr **3.24** = 0 or 1, and is 40,000rpm when Pr **3.24** = 2 or 3.

# 8.6.2 Field weakening (constant power) operation

(Open loop and closed loop vector mode only)

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

Figure 8-3 Torque and rated voltage against speed

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily.

The saturation breakpoint parameters (Pr **5.29** and Pr **5.30**) found during the autotune in closed loop vector mode ensure the magnetizing current is reduced in the correct proportion for the specific motor. (In open loop mode the magnetizing current is not actively controlled).

#### 8.6.3 Servo high speed operation

High speed servo mode is enabled by setting Pr **5.22** =1. Care must be taken when using this mode with servo motors to avoid damaging the drive. The voltage produced by the servo motor magnets is proportional to speed. For high speed operation the d244

rive must apply currents to the motor to counter-act the flux produced by the magnets. It is possible to operate the motor at very high speeds that would give a very high motor terminal voltage, but this voltage is prevented by the action of the drive. If however, the drive is disabled (or tripped) when the motor voltages would be higher than the rating of the drive without the currents to counter-act the flux from the magnets, it is possible to damage the drive. If high speed mode is enabled the motor speed must be limited to the levels given in the table below unless an additional hardware protection system is used to limit the voltages applied to the drive output terminals to a safe level.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

Drive voltage rating	Maximum motor speed (rpm)	Maximum safe line to line voltage at the motor terminals (V rms)
400	800 x 1000 / (Ke x √2)	800 / √2
690	1145 x 1000 / (Ke x √2)	1145 / √2

Ke is the ratio between r.m.s. line to line voltage produced by the motor and the speed in V/1000rpm. Care must also be taken not to demagnetize the motor. The motor manufacturer should always be consulted before using this mode.

#### 8.6.4 Switching frequency

With a default switching frequency of 3 kHz the maximum output frequency should be limited to 250 Hz. Ideally a minimum ratio of 12:1 should be maintained between the switching frequency and the output frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level. If this is not possible, quasi-square switching should be enabled (Pr 5.20 =1). The output waveform will be quasi square above base speed ensuring a symmetrical output waveform, which results in a better quality output than would otherwise result.

#### 8.6.5 Maximum speed / frequency

In open loop mode the maximum frequency is 550 Hz.

In closed loop vector mode the maximum output frequency is 550 Hz.

In servo mode the maximum output frequency is 550 Hz, however the speed is limited by the voltage constant (Ke) of the motor. Ke is a specific constant for the servo motor being used. It can normally be found on the motor data sheet in V/krpm (volts per 1,000rpm).

#### 8.6.6 Quasi-Square wave (open-loop only)

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **5.20** (Quasi-square wave enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage. The modulation depth will increase beyond unity; first producing trapezoidal and then quasi-square waveforms.

This can be used for example:

 To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth,

or

 In order to maintain a higher output voltage with a low supply voltage.

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency. The additional low order harmonics cause increased losses and heating in the motor.

Safety Product Mechanical Electrical Getting Basic Running information installation Installation

# 9 SMARTCARD operation

#### 9.1 Introduction

This is a standard feature that enables simple configuration of parameters in a variety of ways. The SMARTCARD can be used for:

- · Parameter copying between drives
- · Saving whole drive parameter sets
- · Saving 'differences from default' parameter sets
- · Storing Onboard PLC programs
- Automatically saving all user parameter changes for maintenance purposes
- · Loading complete motor map parameters

The SMARTCARD is located at the top of the module under the drive display (if installed) on the left-hand side. Ensure the SMARTCARD is inserted with the SP1-9 arrow pointing upwards.

The drive only communicates with the SMARTCARD when commanded to read or write, meaning the card may be "hot swapped"

#### Encoder phase angle (servo mode only)

With drive software version V01.08.00 onwards, the encoder phase angles in Pr **3.25** and Pr **21.20** are copied to the SMARTCARD when using any of the SMARTCARD transfer methods.

With drive software version V01.05.00 to V01.07.01, the encoder phase angles in Pr **3.25** and Pr **21.20** are only copied to the SMARTCARD when using either Pr **0.30** set to Prog (2) or Pr **xx.00** set to 3yyy.

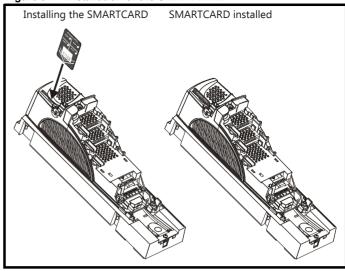

This is useful when the SMARTCARD is used to back-up the parameter set of a drive but caution should be used if the SMARTCARD is used to transfer parameter sets between drives. Unless the encoder phase angle of the servo motor connected to the destination drive is known to be the same as the servo motor connected to the source drive, an autotune should be performed or the encoder phase angle should be entered manually into Pr 3.25 (or Pr 21.20). If the encoder phase angle is incorrect the drive may lose control of the motor resulting in an O.SPd or Enc10 trip when the drive is enabled.

With drive software version V01.04.00 and earlier, or when using software version V01.05.00 to V01.07.01 and Pr xx.00 set to 4yyy is used, then the encoder phase angles in Pr 3.25 and Pr 21.20 are not copied to the SMARTCARD. Therefore, Pr 3.25 and Pr 21.20 in the destination would not be changed during a transfer of this data block from the SMARTCARD.

Be aware of possible live terminals when inserting or removing the SMATRTCARD

Figure 9-1 Installation of the SMARTCARD

### Easy saving and reading

#### Figure 9-2 Basic SMARTCARD operation

Drive reads all parameters from the SMARTCARD

Pr 0.30 = rEAd +

Programs all drive parameters to the . SMARTCARD

#### NOTE

Overwrites anv data already in data block 1

 $Pr \ 0.30 = Prog + \bigcirc$ 

Drive automatically writes to the **SMARTCARD** when a parameter save is performed

Pr 0.30 = Auto +

Drive boots from the SMARTCARD on power up and automatically writes to the SMARTCARD when a parameter save is performed

Pr 0.30 = boot +

The SMARTCARD has 999 individual data block locations. Each individual location from 1 to 499 can be used to store data until the capacity of the SMARTCARD is used. The drive can support SMARTCARDs with a capacity of between 4kB and 512kB.

The data block locations of the SMARTCARD are arranged to have the following usage:

Table 9-1 SMARTCARD data blocks

Data Block	Type	Example Use
1 to 499	Read / Write	Application set ups
500 to 999	Read Only	Macros

'Differences from default' parameter sets will be much smaller than whole parameter sets and thus take up a lot less memory as most applications only require a few parameters to be changed from the

The whole card may be protected from writing or erasing by setting the read-only flag as detailed section 9.2.9 9888 / 9777 - Setting and clearing the SMARTCARD read only flag on page 131.

Data transfer to or from the SMARTCARD is indicated by one the following:

- SM-Keypad: The decimal point after the fourth digit in the upper display will flash
- SM-Keypad Plus: The symbol 'CC' will appear in the lower left hand corner of the display

The card should not be removed during data transfer, as the drive will produce a trip. If this occurs then either the transfer should be reattempted or in the case of a card to drive transfer, default parameters should be loaded.

#### 9.2 Transferring data

Data transfer, erasing and protecting the information is performed by entering a code in Pr xx.00 and then resetting the drive as shown in Table 9-2.

Table 9-2 SMARTCARD codes

Code	Action
2001	Transfer drive parameters as difference from defaults to a bootable SMARTCARD block in data block number 001
Зууу	Transfer drive parameters to a SMARTCARD block number yyy
4ууу	Transfer drive data as difference from defaults to SMARTCARD block number yyy
5ууу	Transfer drive Onboard PLC program to SMARTCARD block number yyy
6ууу	Transfer SMARTCARD data block yyy to the drive
7ууу	Erase SMARTCARD data block yyy
8ууу	Compare drive parameters with block yyy
9555	Clear SMARTCARD warning suppression flag (V01.07.00 and later)
9666	Set SMARTCARD warning suppression flag (V01.07.00 and later)
9777	Clear SMARTCARD read-only flag
9888	Set SMARTCARD read-only flag
9999	Erase SMARTCARD

Where yyy indicates the block number 001 to 999. See Table 9-1 for restrictions on block numbers.

#### NOTE

If the read only flag is set then only codes 6yyy or 9777 are effective.

#### Writing to the SMARTCARD 3vvv - Transfer data to the SMARTCARD

The data block contains the complete parameter data from the drive, i.e. all user save (US) parameters except parameters with the NC coding bit set. Power-down save (PS) parameters are not transferred to the SMARTCARD.

With software V01.06.02 and earlier, a save must have been performed on the drive to transfer the parameters from the drive RAM to the EEPROM before the transfer to the SMARTCARD is carried out.

Safety Product information Installation Inst

#### 4vvv - Write default differences to a SMARTCARD

The data block only contains the parameter differences from the last time default settings were loaded.

Six bytes are required for each parameter difference. The data density is not as high as when using the 3yyy transfer method as described in the previous section, but in most cases the number of differences from default is small and the data blocks are therefore smaller. This method can be used for creating drive macros. Power-down save (PS) parameters are not transferred to the SMARTCARD.

The data block format is different depending on the software version. The data block holds the following parameters:

#### Software V01.06.02 and earlier

All user save (US) parameters, except those with the NC (Not copied) coding bit set or those that do not have a default value, can be transferred to the SMARTCARD.

#### Software V01.07.xx

All user save (US) parameters, except those with the NC (Not copied) coding bit set or those that do not have a default value, can be transferred to the SMARTCARD. In addition to these parameters all menu 20 parameters (except Pr 20.00), can be transferred to the SMARTCARD even though they are not user save parameters and have the NC coding bit set.

#### Software V01.08.00 onwards

All user save (US) parameters including those that do not have a default value (i.e. Pr 3.25 or Pr 21.20 Encoder phase angle), but not including those with the NC (Not copied) coding bit set can be transferred to the SMARTCARD. In addition to these parameters all menu 20 parameters (except Pr 20.00), can be transferred to the SMARTCARD even though they are not user save parameters and have the NC coding bit set.

It is possible to transfer parameters between drives with each of the different formats, however, the data block compare function does not work with data produced by different formats.

# Writing a parameter set to the SMARTCARD (Pr 11.42 = Prog (2))

Setting Pr 11.42 to Prog (2) and resetting the drive will save the parameters to the SMARTCARD, i.e. this is equivalent to writing 3001 to Pr xx.00. All SMARTCARD trips apply except 'C.Chg'. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to nonE (0).

#### 9.2.2 Reading from the SMARTCARD

#### 6yyy - Read default differences from a SMARTCARD

When the data is transferred back to a drive, using 6yyy in Pr xx.00, it is transferred to the drive RAM and the drive EEPROM. A parameter save is not required to retain the data after power-down. Set up data for any Solutions Modules installed are stored on the card and are transferred to the destination drive. If the Solutions Modules are different between the source and destination drive, the menus for the slots where the Solutions Module categories are different are not updated from the card and will contain their default values after the copying action. The drive will produce a 'C.Optn' trip if the Solutions Modules installed to the source and destination drive are different or are in different slots. If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a SMARTCARD when the rating of the destination drive is different from the source drive and the file is a parameter file (i.e. created using the 3yyy transfer method). However, with software V01.09.00 and later drive rating dependent parameters will be transferred if only the current rating is different and the file is a differences from default type file (i.e. created using the 4yyy transfer method). If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

Pr 6.48 Line power supply loss ride through detection level

# Reading a parameter set from the SMARTCARD (Pr 11.42 = rEAd (1))

Setting Pr 11.42 to rEAd (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr xx.00. All SMARTCARD trips apply. Once the parameters are successfully copied this parameter is automatically reset to nonE (0). Parameters are saved to the drive EEPROM after this action is complete.

#### NOTE

This operation is only performed if data block 1 on the card is a full parameter set (3yyy transfer) and not a default difference file (4yyy transfer). If block 1 does not exist a 'C.dAt' trip occurs.

# 9.2.3 Auto saving parameter changes (Pr 11.42 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the SMARTCARD. The latest menu 0 parameter set in the drive is therefore always backed up on the SMARTCARD. Changing Pr 11.42 to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all user save (US) parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the card when  $\Pr$  **xx.00** is set to a 1000 and the drive reset.

All SMARTCARD trips apply, except 'C.Chg'. If the data block already contains information it is automatically overwritten.

If the card is removed when Pr **11.42** is set to 3 Pr **11.42** is then automatically set to nonE (0).

When a new SMARTCARD is installed Pr **11.42** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new SMARTCARD if auto mode is still required.

When Pr **11.42** is set to Auto (3) and the parameters in the drive are saved, the SMARTCARD is also updated, therefore the SMARTCARD becomes a copy of the drives stored configuration.

At power up, if Pr 11.42 is set to Auto (3), the drive will save the complete parameter set to the SMARTCARD. The drive will display 'cArd' during this operation. This is done to ensure that if a user puts a new SMARTCARD in during power down the new SMARTCARD will have the correct data.

#### NOTE

When Pr 11.42 is set to Auto (3) the setting of Pr 11.42 itself is saved to the drive EEPROM but NOT to the SMARTCARD.

# 9.2.4 Booting up from the SMARTCARD on every power up (Pr 11.42 = boot (4))

When Pr 11.42 is set to boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the SMARTCARD will be automatically transferred to the drive at power up if the following are true:

- · A card is inserted in the drive
- Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 5 (as defined in Pr 11.38)
- Pr 11.42 on the card set to boot (4)

The drive will display 'boot' during this operation. If the drive mode is different from that on the card, the drive gives a 'C.Typ'. trip and the data is not transferred.

If 'boot' mode is stored on the copying SMARTCARD this makes the copying SMARTCARD the master device. This provides a very fast and efficient way of re-programming a number of drives.

If data block 1 contains a bootable parameter set and data block 2 contains an Onboard PLC program (type 17 as defined in Pr **11.38**), then if the drive software version is V01.07.00 and later, the onboard PLC program will be transferred to the drive at power up along with the parameter set in data block 1.

#### NOTE

'Boot' mode is saved to the card, but when the card is read, the value of Pr 11.42 is not transferred to the drive.

# 9.2.5 Booting up from the SMARTCARD on every power up (Pr xx.00 = 2001), software V01.08.00 and later

It is possible to create a difference from default bootable file by setting Pr xx.00 to 2001 and resetting the drive. This type of file causes the drive to behave in the same way at power-up as a file created with boot mode set up with Pr 11.42. The difference from the default file is that it has the added advantage of including menu 20 parameters.

Setting Pr xx.00 to 2001 will overwrite data block 1 on the card if it already exists.

If a data block 2 exists and contains an Onboard PLC program (type 17 as defined in Pr **11.38**), this will also be loaded after the parameters have been transferred

A bootable difference from default file can only be created in one operation and parameters cannot be added as they are saved via menu 0.

# 9.2.6 8yyy - Comparing the drive full parameter set with the SMARTCARD values

Setting 8yyy in Pr xx.00, will compare the SMARTCARD file with the data in the drive. If the compare is successful Pr xx.00 is simply set to 0. If the compare fails a 'C.cpr' trip is initiated.

# 9.2.7 7yyy / 9999 - Erasing data from the SMARTCARD

Data can be erased from the SMARTCARD either one block at a time or all blocks in one go.

- Setting 7yyy in Pr xx.00 will erase SMARTCARD data block yyy.
- Setting 9999 in Pr xx.00 will erase all SMARTCARD data blocks

# 9.2.8 9666 / 9555 - Setting and clearing the SMARTCARD warning suppression flag (V01.07.00 and later)

If the Solutions Modules installed to the source and destination drive are different or are in different slots the drive will produce a 'C.Optn' trip. If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the Solutions Module(s) or drive ratings are different between the source and destination drives. The Solutions Module or rating dependent parameters will not be transferred.

- Setting 9666 in Pr xx.00 will set the warning suppression flag
- · Setting 9555 in Pr xx.00 will clear the warning suppression flag

# 9.2.9 9888 / 9777 - Setting and clearing the SMARTCARD read only flag

The SMART CARD may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'C.rdo' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are effective.

- Setting 9888 in Pr xx.00 will set the read only flag
- Setting 9777 in Pr xx.00 will clear the read only flag.

#### 9.3 Data block header information

Each data block stored on a SMARTCARD has header information detailing the following:

- A number which identifies the block (Pr 11.37)
- The type of data stored in the block (Pr 11.38)
- The drive mode if the data is parameter data (Pr 11.38)
- The version number (Pr 11.39)
- The checksum (Pr 11.40)
- · The read-only flag
- The warning suppression flag (V01.07.00 and later)

The header information for each data block which has been used can be viewed in Pr 11.38 to Pr 11.40 by increasing or decreasing the data block number set in Pr 11.37.

#### Software V01.07.00 and later

If Pr 11.37 is set to 1000 the checksum parameter (Pr 11.40) shows the number of 16 byte pages left on the card.

If Pr 11.37 is set to 1001 the checksum parameter (Pr 11.40) shows the total capacity of the card in 16 byte pages. Therefore, for a 4kB card this parameter would show 254.

If Pr 11.37 is set to 1002 the checksum parameter (Pr 11.40) shows the state of the read-only (bit 0) and warning suppression flags (bit 1).

Software version V01.11.00 and later: If Pr **11.37** is set to 1003, the checksum parameter (Pr **11.40**) shows the product identifier (255 = Unidrive SP, 1 = Commander GP20, 2 = Digitax ST, 3 = Affinity).

If there is no data on the card Pr **11.37** can only have values of 0 or 1000 to 1003.

#### Software V01.06.02 and earlier

If Pr 11.37 is set to 1000 the checksum parameter (Pr 11.40) shows the number of bytes left on the card. If there is no data on the card Pr 11.37 can only have values of 0 or 1000.

The version number is intended to be used when data blocks are used as drive macros. If a version number is to be stored with a data block, Pr 11.39 should be set to the required version number before the data is transferred. Each time Pr 11.37 is changed by the user the drive puts the version number of the currently viewed data block in Pr 11.39.

If the destination drive has a different drive mode to the parameters on the card, the drive mode will be changed by the action of transferring parameters from the card to the drive.

The actions of erasing a card, erasing a file, changing a menu 0 parameter, or inserting a new card will effectively set Pr **11.37** to 0 or the lowest file number in the card.

#### 9.4 SMARTCARD parameters

Table 9-3 Key to parameter table coding

# 9.5 SMARTCARD trips

After an attempt to read, write or erase data to or from a SMARTCARD a trip may occur if there has been a problem with the command. The following trips indicate various problems as detailed in Table 9-4.

Table 9-4 Trip conditions

Trip	Diagnosis
C.Acc	SMARTCARD trip: SMARTCARD Read / Write fail
40-	Check SMARTCARD is installed / located correctly
185	Ensure SMARTCARD is not writing data to data location 500 to 999  Replace SMARTCARD
	SMARTCARD trip: The menu 0 parameter modification cannot be saved to the SMARTCARD because the necessary file has
C.boot	not been created on the SMARTCARD
	A write to a menu 0 parameter has been initiated via the keypad with Pr 11.42 set to auto(3) or boot(4), but the necessary file on the
177	SMARTCARD has not been created
	Ensure that Pr 11.42 is correctly set and reset the drive to create the necessary file on the SMARTCARD
C.bUSY	Re-attempt the parameter write to the menu 0 parameter  SMARTCARD trip: SMARTCARD can not perform the required function as it is being accessed by a Solutions Module
178	Wait for the Solutions Module to finish accessing the SMARTCARD and then re-attempt the required function
C.Chg	SMARTCARD trip: Data location already contains data
179	Erase data in data location Write data to an alternative data location
C.Cpr	SMARTCARD trip: The values stored in the drive and the values in the data block on the SMARTCARD are different
188	Press the red  reset button
C.dat	SMARTCARD trip: Data location specified does not contain any data
183	Ensure data block number is correct
C.Err	SMARTCARD trip: SMARTCARD data is corrupted
C.EII	Ensure the card is located correctly
182	Erase data and retry
	Replace SMARTCARD
C.Full	SMARTCARD trip: SMARTCARD full
184	Delete a data block or use a different SMARTCARD
C.Optn	SMARTCARD trip: Solutions Modules installed are different between source drive and destination drive
	Ensure correct Solutions Modules are installed
180	Ensure Solutions Modules are in the same Solutions Module slot
	Press the red  reset button
C.Prod	SMARTCARD trip: The data blocks on the SMARTCARD are not compatible with this product
175	Erase all data on the SMARTCARD by setting Pr xx.00 to 9999 and pressing the red  reset button
	Replace SMARTCARD
C.rdo	SMARTCARD trip: SMARTCARD has the Read only bit set
181	Enter 9777 in Pr xx.00 to allow SMARTCARD Read / Write access
	Ensure the drive is not writing to data locations 500 to 999 on the card

# 10 Onboard PLC

#### 10.1 Onboard PLC and SYPTLite

The drive has the ability to store and execute a 4KB Onboard PLC ladder logic program without the need for additional hardware in the form of a Solutions Module.

The ladder logic program is written using SYPTLite, a Windows™ based ladder diagram editor allowing the development of programs for execution in Unidrive SP or SM-Applications Lite.

SYPTLite is designed to be easy to use and to make program development as simple as possible. The features provided are a sub-set of those in the SYPT program editor. SYPTLite programs are developed using ladder logic, a graphical language widely used to program PLCs (IEC61131-3). SYPTLite allows the user to "draw" a ladder diagram representing a program.

SYPTLite provides a complete environment for the development of ladder diagrams. Ladder diagrams can be created, compiled into user programs and downloaded to a Unidrive SP or SM-Applications Lite for execution, via the RJ45 serial communications port on the front of the drive. The run-time operation of the compiled ladder diagram on the target can also be monitored using SYPTLite and facilities are provided to interact with the program on the target by setting new values for target parameters.

SYPTLite is available on the CD which is supplied with the drive.

#### 10.2 Benefits

The combination of the Onboard PLC and SYPTLite, means that the drive can replace nano and some micro PLCs in many applications. The Onboard PLC programs can consist of up to a maximum of 50 ladder logic rungs (up to 7 function blocks and 10 contacts per rung). The Onboard PLC program can also be transferred to and from a SMARTCARD for backup or quick commissioning/start-up

In addition to the basic ladder symbols, SYPTLite contains a sub-set of the function from the full version of SYPT. These include,

- · Arithmetic blocks
- Comparison blocks
- Timers
- Counters
- Multiplexers
- Latches
- Bit manipulation

Typical applications for the Onboard PLC include,

- · Ancillary pumps
- · Fans and control valves
- Interlocking logic
- · Sequences routines
- Custom control words.

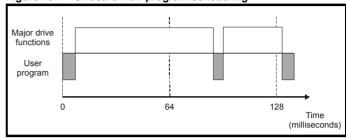

#### 10.3 Limitations

Compared with the Applications Modules (SM-Applications, SM-Applications Lite and SM-Applications Plus) when programmed with SYPT, the Onboard PLC program has the following limitations:

- The maximum program size is 4032 bytes including header and optional source code.
- The drive is rated for 100 program downloads. This limitation is imposed by the flash memory used to store the program within the drive.
- The user cannot create user variables. The user is only able to manipulate the drive parameter set.
- The program cannot be downloaded or monitored over CTNet. The program is only accessible via the drives RJ45 serial communications port.

- There are no real-time tasks, i.e. the scheduling rate of the program cannot be guaranteed. Applications Modules tasks such as Clock, Event, Pos0 or Speed are not available.
- The Onboard PLC should not be used for time-critical applications.
   For time-critical applications Unidrive SP and an SM-Applications Plus, SM-Applications or SM-Applications Lite should be used.
- The program runs at a low priority. The drive provides a single background task in which to run a ladder diagram. The drive is prioritized to perform its major functions first, e.g. motor control, and will use any remaining processing time to execute the ladder diagram as a background activity. As the drive's processor becomes more heavily loaded, less time is spent executing the program.

Figure 10-1 Onboard PLC program scheduling

The user program is scheduled for a short period approximately once every 64ms. The time for which the program is scheduled will vary between 0.2ms and 2ms depending on the loading of the drive's processor.

When scheduled, several scans of the user program may be performed. Some scans may execute in microseconds. However, when the main drive functions are scheduled there will be a pause in the execution of the program causing some scans to take many milliseconds. SYPTLite displays the average execution time calculated over the last 10 scans of the user program.

The Onboard PLC and SYPTLite form the first level of functionality in a range of programmable options for Unidrive SP.

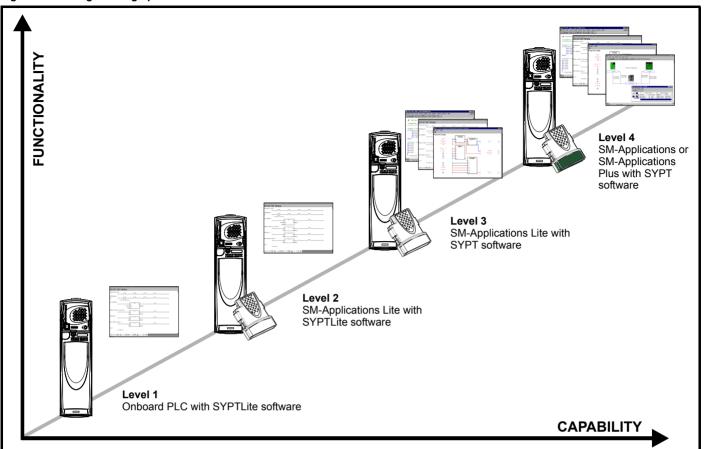

Figure 10-2 Programming options for Unidrive SP

SYPTLite can be used with either the Onboard PLC in the Unidrive SP or with SM-Applications Lite to create ladder logic programs.

SYPT can be used with any of the Applications Modules to create fully flexible programs using ladder logic, function blocks or DPL script.

### 10.4 Getting started

SYPTLite can be found on the CD which is supplied with the drive.

#### SYPTLite system requirements

- Windows 2000/XP/Vista. Windows 95/98/98SE/Me/NT4 are not supported
- Pentium III 500MHz or better recommended
- 128MB RAM
- Minimum of 800x600 screen resolution. 1024x768 is recommended
- Adobe Acrobat 5.10 or later (for viewing User Guides)
- · Microsoft Internet Explorer V5.0 or later
- RS232 to RS485, RJ45 communications lead to connect the PC to the drive
- · Administrator rights are required to install the software

To install SYPTLite, insert the CD and the auto-run facility should start up the front-end screen, from which SYPTLite can be selected.

See the SYPTLite help file for more information regarding using SYPTLite, creating ladder diagrams and the available function blocks.

# 10.5 Onboard PLC parameters

The following parameters are associated with the Onboard PLC program.

11.47			Drive Onboard PLC program enable									
R۷	V	Uni								US		
<b>Û</b>			0 to	2		$\Diamond$			2			

This parameter is used to start and stop the drive Onboard PLC program.

Value	Description
0	Halt the drive Onboard PLC program.
1	Run the drive Onboard PLC program (if installed). Any out-of- range parameter writes attempted will be clipped to the maximum / minimum values valid for that parameter before being written.
2	Run the drive Onboard PLC program (if installed). Any out-of- range parameter writes attempted will cause a 'UP ovr' trip.

		11.4	48	Drive Onboard PLC program status										
ı	RC	)	Bi						NC	PT				
	<b>Û</b>		-	128 to -	+127		$\Rightarrow$							

The drive Onboard PLC program status parameter indicates to the user the actual state of the drive Onboard PLC program.

-													
Safety	Product	Mechanical	Electrical	Getting	Basic	Runnina		SMARTCARD	Onboard	Advanced	Technical		UL Listina
Carcty	1 TOULOU	Micchaillean	Liccincai	Octung	Dasic	rturining	Ontimization	CIVIALLICALE	Chiboara	Advanced	recrimical	Diagnostics	OL LISTING

Value	Description
-n	Onboard PLC program caused a drive trip due to an error condition while running rung n. Note that the rung number is shown on the display as a negative number.
0	Onboard PLC program is not installed.
1	Onboard PLC program is installed but stopped.
2	Onboard PLC program is installed and running.

When an Onboard PLC program is installed and running, the lower display of the drive flashes 'PLC' once every 10s.

	11.49 Drive Onboard PLO						ogra	ammin	g even	ts	
R	RO Uni							NC	PT		PS
<b>Û</b>	0 to 65,535					$\Diamond$					

The drive Onboard PLC programming events parameter holds the number of times an Onboard PLC program download has taken place and is 0 on dispatch from the factory. The drive is rated for one hundred ladder program downloads. This parameter is not altered when defaults are loaded.

	11.	50	Drive Onboard PLC program average scan time										
R	RO Uni							NC	PT				
$\hat{\mathbf{U}}$	0 to 65,535 ms					$\Rightarrow$							

This parameter is updated once per second or once per Onboard PLC program scan whichever is the longest. If more than one program scan occurs within the one second update period the parameter shows the average scan time. If the program scan time is longer than one second the parameter shows the time for the last program scan.

	11.	51	Drive Onboard PLC program first run									
R	O Bit							NC	PT			
$\hat{\mathbf{U}}$	OFF (0) or On (1)					$\stackrel{\frown}{\Box}$						

The Drive Onboard PLC program first run parameter is set for the duration of program scan from the stopped state. This enables the user to perform any required initialisation every time the program is run. This parameter is set every time the program is stopped.

# 10.6 Onboard PLC trips

The following trips are associated with the Onboard PLC program.

Tuin	Diamasia
Trip	Diagnosis
UP ACC	Onboard PLC program: Cannot access Onboard PLC program file on drive
98	Disable drive - write access is not allowed when the drive is enabled.  Another source is already accessing Onboard PLC program - retry once the other action is complete.
UP div0	Onboard PLC program attempted divide by zero
90	Check program
UP OFL	Onboard PLC program variables and function block calls using more than the allowed RAM space (stack overflow)
95	Check program
UP ovr	Onboard PLC program attempted out of range parameter write
94	Check program
UP PAr	Onboard PLC program attempted access to a non-existent parameter
91	Check program
UP ro	Onboard PLC program attempted write to a read- only parameter
92	Check program
UP So	Onboard PLC program attempted read of a write- only parameter
93	Check program
UP udF	Onboard PLC program undefined trip
97	Check program
UP uSEr	Onboard PLC program requested a trip
96	Check program

#### 10.7 Onboard PLC and the SMARTCARD

The Onboard PLC program in a drive may be transferred from the drive to a SMARTCARD and vice versa.

- To transfer an Onboard PLC program from the drive to a SMARTCARD, set Pr xx.00 to 5yyy and reset the drive
- To transfer an Onboard PLC program from the SMARTCARD to a drive, set Pr xx.00 to 6yyy and reset the drive.

(Where yyy is the data block location, see Table 9-1 *SMARTCARD data blocks* on page 129 for restrictions on block numbers).

If an attempt is made to transfer an Onboard PLC program from a drive to the SMARTCARD when the drive contains no program, the block is still created on the SMARTCARD but it will contain no data. If this data block is then transferred to a drive, the destination drive will then have no Onboard PLC program.

The smallest SMARTCARD compatible with Unidrive SP has a capacity of 4064 bytes and each block can be up to 4064 bytes in size. The maximum size of a user program is 4032 bytes so it is guaranteed that any Onboard PLC program downloaded to a Unidrive SP will fit on to an empty SMARTCARD. A SMARTCARD can contain a number of Onboard PLC programs until the capacity of the card is used.

# 11 Advanced parameters

This is a quick reference to all parameters in the drive showing units, ranges limits etc, with block diagrams to illustrate their function. Full descriptions of the parameters can be found in the *Advanced User Guide* on the supplied CD ROM.

These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Advanced User Guide*.

Table 11-1 Menu descriptions

Menu number	Description
0	Commonly used basic set up parameters for quick / easy programming
1	Frequency / speed reference
2	Ramps
3	Frequency slaving, speed feedback and speed control
4	Torque and current control
5	Motor control
6	Sequencer and clock
7	Analog I/O
8	Digital I/O
9	Programmable logic, motorized pot and binary sum
10	Status and trips
11	General drive set-up
12	Threshold detectors and variable selectors
13	Position control
14	User PID controller
18	Application menu 1
19	Application menu 2
20	Application menu 3
21	Second motor parameters
22	Additional Menu 0 set-up

#### Operation mode abbreviations:

OL> Open loop

CL> Closed loop (which incorporates closed loop vector and

servo mode)

VT> Closed loop vector mode

SV> Servo

#### Default abbreviations:

EUR> European default value (50Hz AC supply frequency)

USA> USA default value (60Hz AC supply frequency)

#### NOTE

Parameter numbers shown in brackets {...} are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

The Range - CL column applies to both Closed-loop Vector and Closed-loop Servo. For some parameters, this column applies only to one of these modes; this is indicated accordingly in the Default columns.

In some cases, the function or range of a parameter is affected by the setting of another parameter; the information in the lists relates to the default condition of such parameters.

Table 11-2 Key to parameter table coding

Coding	Attribute
RW	Read/write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'OFF' on the display
Bi	Bipolar parameter
Uni	Unipolar parameter
Txt	Text: the parameter uses text strings instead of numbers.
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will not be transferred to the destination drive by SMARTCARDs when the rating of the destination drive is different from the source drive and the file is a parameter file. However, with software V01.09.00 and later the value will be transferred if only the current rating is different and the file is a differences from default type file.
NC	Not copied: not transferred to or from SMARTCARDs during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) trip occurs. With software version V01.08.00 and later, power-down save parameters are also saved in the drive when the user initiates a parameter save.

### Parameter ranges and variable maximums:

The two values provided define the minimum and maximum values for the given parameter. In some cases the parameter range is variable and dependant on either:

- · other parameters
- the drive rating
- drive mode
- or a combination of these

The values given in Table 11-4 are the variable maximums used in the drive.

Table 11-4 Definition of parameter ranges & variable maximums

Maximum	Definition
SPEED_FREQ_MAX [Open-loop 550.0 Hz, Closed-loop vector and Servo 40000.0rpm]	Maximum speed (closed-loop mode) reference or frequency (open-loop mode) reference  If Pr 1.08 = 0: SPEED_FREQ_MAX = Pr 1.06  If Pr 1.08 = 1: SPEED_FREQ_MAX is Pr 1.06 or – Pr 1.07 whichever is the largest  (If the second motor map is selected Pr 21.01 is used instead of Pr 1.06 and Pr 21.02 instead of Pr 1.07)
SPEED_LIMIT_MAX [40000.0rpm]	Maximum applied to speed reference limits  A maximum limit may be applied to the speed reference to prevent the nominal encoder frequency from exceeding 500kHz (410kHz for software version V01.06.00 and earlier). The maximum is defined by SPEED_LIMIT_MAX (in rpm) = 500kHz x 60 / ELPR = 3.0 x 10 <sup>7</sup> / ELPR subject to an absolute maximum of 40,000 rpm.  ELPR is equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.  Quadrature encoder ELPR = number of lines per revolution  F and D encoder ELPR = number of lines per revolution / 2  Resolver ELPR = resolution / 4  SINCOS encoder ELPR = number of sine waves per revolution  Serial comms encoder ELPR = resolution / 4  This maximum is defined by the device selected with the speed feedback selector (Pr 3.26) and the ELPR set for the position feedback device.  In closed-loop vector RFC mode SPEED_LIMIT_MAX = 40,000rpm.
SPEED_MAX [40000.0rpm]	Maximum speed This maximum is used for some speed related parameters in menu 3. To allow headroom for overshoot etc. the maximum speed is twice the maximum speed reference.  SPEED_MAX = 2 x SPEED_FREQ_MAX
RATED_CURRENT_MAX [9999.99A]	Maximum motor rated current (Maximum Normal Duty current rating)  RATED_CURRENT_MAX = $1.36 \times K_C$ .  The motor rated current can be increased above $K_C$ up to a level not exceeding $1.36 \times K_C$ ). (Maximum motor rated current is the maximum normal duty current rating).  The actual level varies from one drive size to another, refer to Table 11-5.
DRIVE_CURRENT_MAX [9999.99A]	Maximum drive current The maximum drive current is the current at the over current trip level and is given by: $DRIVE\_CURRENT\_MAX = K_C / 0.45$
AC_VOLTAGE_SET_MAX [690V]	Maximum output voltage set-point Defines the maximum motor voltage that can be selected. 200V drives: 240V, 400V drives: 480V 575V drives: 575V, 690V drives: 690V
AC_VOLTAGE_MAX [930V]	Maximum AC output voltage This maximum has been chosen to allow for maximum AC voltage that can be produced by the drive including quasi-square wave operation as follows: AC_VOLTAGE_MAX = 0.78 x DC_VOLTAGE_MAX 200V drives: 325V, 400V drives: 650V, 575V drives: 780V, 690V drives: 930V
DC_VOLTAGE_SET_MAX [1150V]	Maximum DC voltage set-point 200V rating drive: 0 to 400V, 400V rating drive: 0 to 800V 575V rating drive: 0 to 955V, 690V rating drive: 0 to 1150V
DC_VOLTAGE_MAX [1190V]	Maximum DC bus voltage The maximum measurable DC bus voltage. 200V drives: 415V, 400V drives: 830V, 575V drives: 990V, 690V drives: 1190V

Maximum	Definition
	Maximum current limit settings for motor map 1 This maximum current limit setting is the maximum applied to the current limit parameters in motor map 1.
	Open Loop  Maximum current   $\frac{1}{2} + PF^2 - 1$   $\frac{1}{2} \times 100\%$
	Where: The Maximum current is either (1.5 x K <sub>C</sub> ) when the motor rated current set in Pr <b>5.07</b> is less than or equal to the maximum Heavy Duty current rating given by Pr <b>11.32</b> , otherwise it is (1.1 x Normal Duty rating).
	Motor rated current is given by Pr 5.07
	PF is motor rated power factor given by Pr 5.10
	Closed Loop vector
MOTOR1_CURRENT_LIMIT_MAX [1000.0%]	Maximum current limit = $\sqrt{\left[\frac{\text{Maximum current}}{\text{Motor rated current}}\right]^2 + \cos(\varphi_1)^2 - 1}$ x 100%
	Where: The Maximum current is either (1.75 x K <sub>C</sub> ) when the motor rated current set in Pr <b>5.07</b> is less than or equal to the maximum Heavy Duty current rating given by Pr <b>11.32</b> , otherwise it is (1.1 x Normal Duty rating).
	Motor rated current is given by Pr 5.07
	$\phi_1$ = cos-1(PF) - $\phi_2$ . This is measured by the drive during an autotune. See Menu 4 in the <i>Advanced User Guide</i> for more information regarding $\phi_2$ .
	PF is motor rated power factor given by Pr 5.10
	Servo
	Maximum current limit = $\left[\frac{\text{Maximum current}}{\text{Motor rated current}}\right] \times 100\%$
	Where: The Maximum current is either (1.75 x K <sub>C</sub> ) when the motor rated current set in Pr <b>5.07</b> is less than or equal to the maximum Heavy Duty current rating given by Pr <b>11.32</b> , otherwise it is (1.1 x Normal Duty rating).
	Motor rated current is given by Pr 5.07
MOTOR2_CURRENT_LIMIT_MAX [1000.0%]	Maximum current limit settings for motor map 2  This maximum current limit setting is the maximum applied to the current limit parameters in motor map 2.  The formulae for MOTOR2_CURRENT_LIMIT_MAX are the same for MOTOR1_CURRENT_LIMIT_MAX except that Pr 5.07 is replaced with Pr 21.07 and Pr 5.10 is replaced with Pr 21.10.
TORQUE_PROD_CURRENT_MAX [1000.0%]	Maximum torque producing current This is used as a maximum for torque and torque producing current parameters. It is MOTOR1_CURRENT_LIMIT_MAX or MOTOR2_CURRENT_LIMIT_MAX depending on which motor map is currently active.
USER_CURRENT_MAX [1000.0%]	Current parameter limit selected by the user  The user can select a maximum for Pr 4.08 (torque reference) and Pr 4.20 (percentage load) to give suitable scaling for analog I/O with Pr 4.24. This maximum is subject to a limit of MOTOR1_CURRENT_LIMIT_MAX. or MOTOR2_CURRENT_LIMIT_MAX depending on which motor map is currently active.  USER_CURRENT_MAX = Pr 4.24
POWER_MAX [9999.99kW]	Maximum power in kW  The maximum power has been chosen to allow for the maximum power that can be output by the drive with maximum AC output voltage, maximum controlled current and unity power factor. Therefore:  Software V01.07.01 and earlier: POWER_MAX = √3 x AC_VOLTAGE_MAX x RATED_CURRENT x 1.75  Software V01.08.00 and later: POWER_MAX = √3 x AC_VOLTAGE_MAX x DRIVE_CURRENT_MAX

The values given in square brackets indicate the absolute maximum value allowed for the variable maximum.

#### \*Encoder phase angle (servo mode only)

With drive software version V01.08.00 onwards, the encoder phase angles in Pr **3.25** and Pr **21.20** are copied to the SMARTCARD when using any of the SMARTCARD transfer methods.

With drive software version V01.05.00 to V01.07.01, the encoder phase angles in Pr **3.25** and Pr **21.20** are only copied to the SMARTCARD when using either Pr **0.30** set to Prog (2) or Pr **xx.00** set to 3yyy.

This is useful when the SMARTCARD is used to back-up the parameter set of a drive but caution should be used if the SMARTCARD is used to transfer parameter sets between drives. Unless the encoder phase angle of the servo motor connected to the destination drive is known to be the same as the servo motor connected to the source drive, an autotune should be performed or the encoder phase angle should be entered manually into Pr 3.25 (or Pr 21.20). If the encoder phase angle is incorrect the drive may lose control of the motor resulting in an O.SPd or Enc10 trip when the drive is enabled. With drive software version V01.04.00 and earlier, or when using software version V01.05.00 to V01.07.01 and Pr xx.00 set to 4yyy is used, then the encoder phase angles in Pr 3.25 and Pr 21.20 are not copied to the SMARTCARD. Therefore, Pr 3.25 and Pr 21.20 in the destination would not be changed during a transfer of this data block from the SMARTCARD.

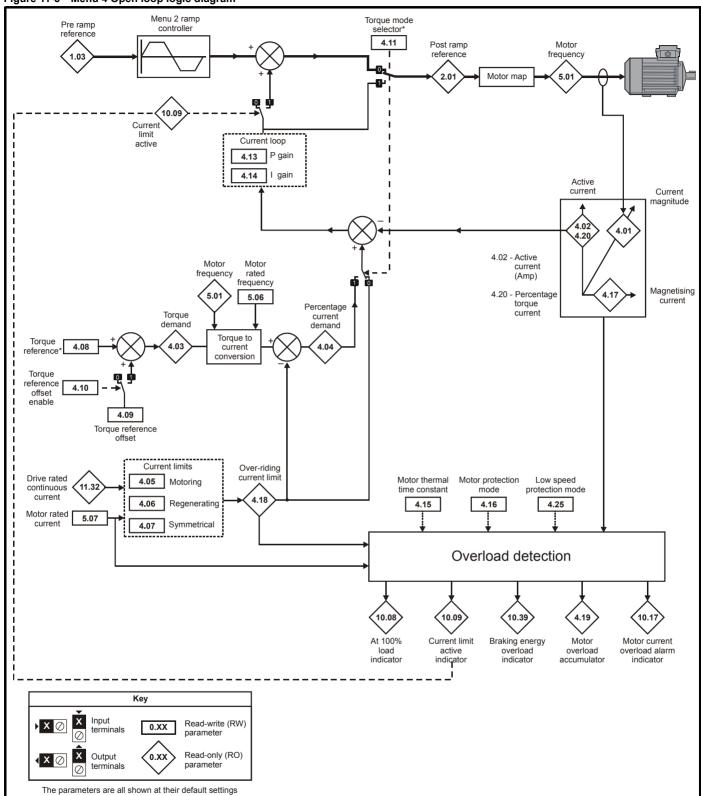

### NOTE

<sup>\*\*</sup>If output voltage from the encoder is >5V, then the termination resistors must be disabled Pr **3.39** to 0.

<sup>\*</sup>For more information, refer to section 11.21.5 Stop modes on page 237.

\*\*\*\*\*The drive thermal model system normally controls the fan speed, however the fan can be forced to operate at full speed if this parameter is set to 1. When this is set to 1 the fan remains at full speed until 10s after this parameter is set to zero. Note that the fan willi only run at full speed if the drive is not in a UU condition.

<sup>\*\*</sup>For more information, refer to section 11.21.6 *Line power supply loss modes* on page 238.

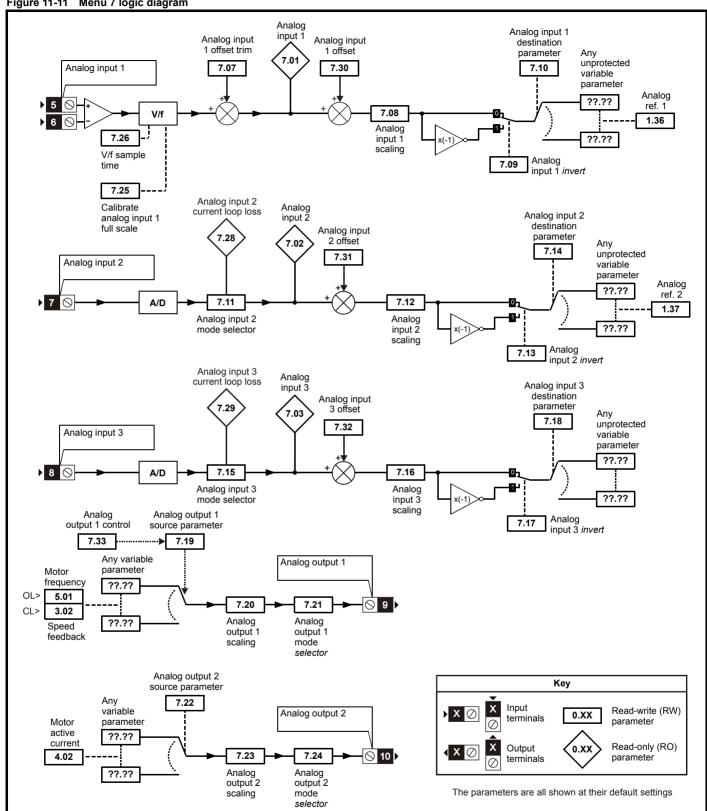

<sup>\*\*\*</sup>For more information, refer to section 11.21.7 Start / stop logic modes on page 240.

<sup>\*\*\*\*</sup>For more information, refer to section 11.21.8 *Catch a spinning motor* on page 241.

## 11.12 Menu 12: Threshold detectors, variable selectors and brake control function

Figure 11-15 Menu 12 logic diagram

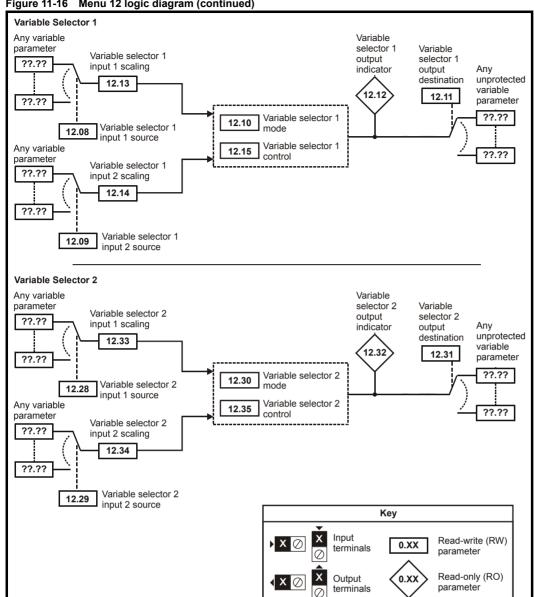

Figure 11-16 Menu 12 logic diagram (continued)

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of a Smartcard in boot mode or an SM-Applications module can ensure drive parameters are immediately programmed to avoid this situation.

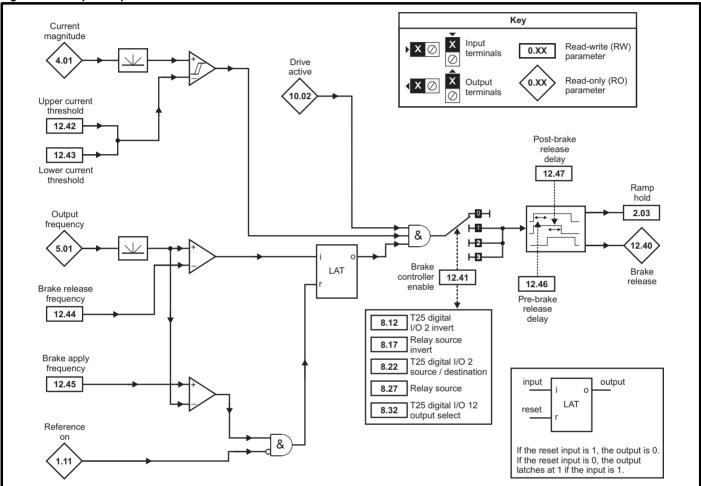

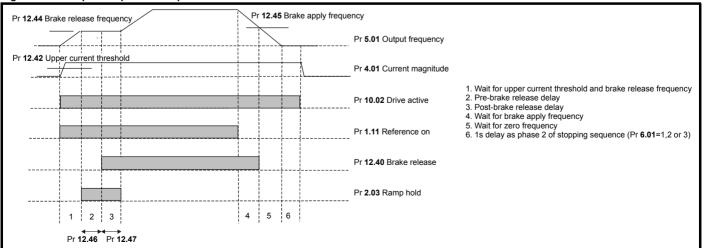

Figure 11-18 Open-loop brake sequence

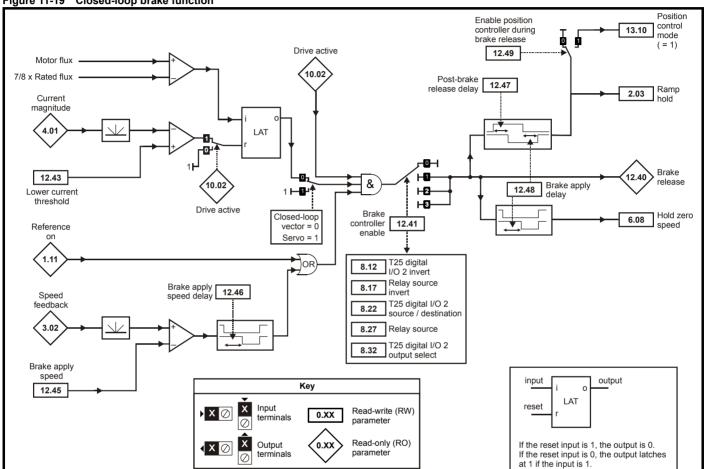

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

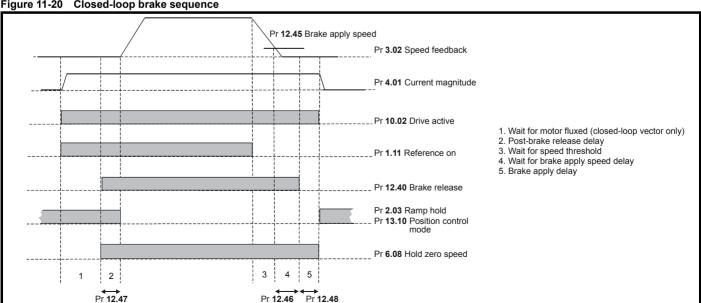

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

parameters are at their default settings

Figure 11-22 Menu 13 Closed-loop logic diagram

<sup>\*</sup>For more information, refer to section 11.21.9 Position modes on page 241.

<sup>\*</sup> The position controller is disabled and the error integrator is also reset under the following conditions:

- 1. If the drive is disabled (i.e. inhibited, ready or tripped)
- 2. If the position controller mode (Pr **13.10**) is changed. The position controller is disabled transiently to reset the error integrator.
- 3. The absolute mode parameter (Pr **13.11**) is changed. The position controller is disabled transiently to reset the error integrator.
- One of the position sources is invalid.
- 5. The position feedback initialised parameter (Pr **3.48**) is zero.

#### **Solutions Module software**

Most Solutions Modules contain software. The software version of the module can be checked by looking at Pr x.02 and Pr x.51.

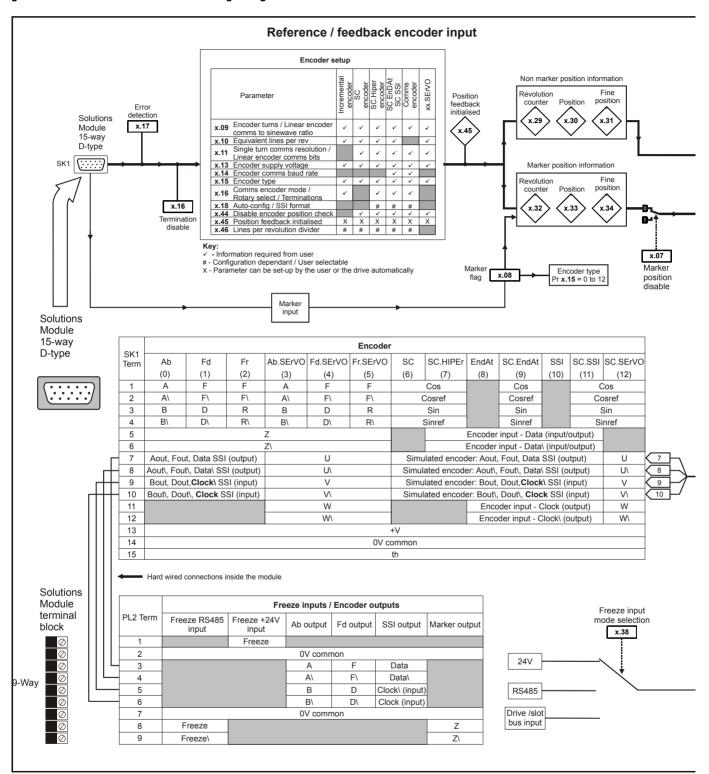

The software version takes the form of zz.yy.xx, where Pr x.02 displays zz.yy and Pr x.51 displays xx. I.e. for software version 01.01.00, Pr x.02 would display 1.01 and Pr x.51 would display 0

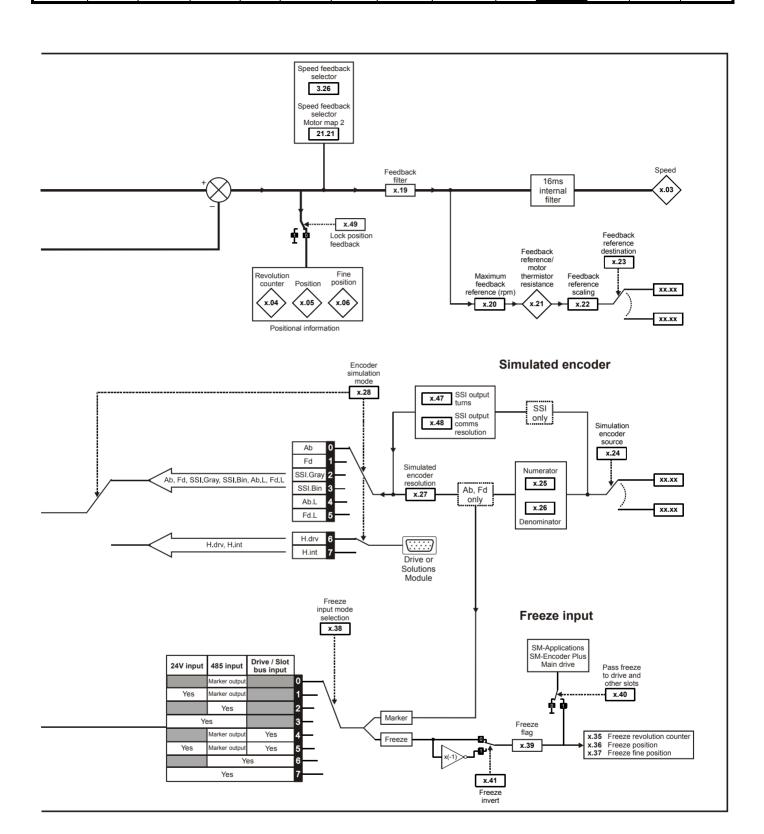

The SM-Resolver, SM-Encoder Plus, SM-Encoder Output Plus and SM-I/O Plus modules do not contain any software, so Pr **x.02** and Pr **x.51** either show 0 (software V01.07.01 and earlier) or the parameters do not appear (software V01.08.00 and later).

<sup>\*</sup> The menu 0 references are only valid when the second motor map parameters have been made active by setting Pr **11.45** to 1. (The second motor map only becomes effective when the output stage of the drive is not enabled, i.e. inh, rdY, or trip states).

When the second motor map parameters are active, the symbol 'Mot2' will appear in the lower left hand corner of the LCD display or the decimal point that is second from the right on the first row of the LED display is lit.

#### Encoder phase angle (servo mode only)

With drive software version V01.08.00 onwards, the encoder phase angles in Pr 3.25 and Pr 21.20 are copied to the SMARTCARD when using any of the SMARTCARD transfer methods.

With drive software version V01.05.00 to V01.07.01, the encoder phase angles in Pr **3.25** and Pr **21.20** are only copied to the SMARTCARD when using either Pr **0.30** set to Prog (2) or Pr **xx.00** set to 3yyy.

This is useful when the SMARTCARD is used to back-up the parameter set of a drive but caution should be used if the SMARTCARD is used to transfer parameter sets between drives.

Unless the encoder phase angle of the servo motor connected to the destination drive is known to be the same as the servo motor connected to the source drive, an autotune should be performed or the encoder phase angle should be entered manually into Pr 3.25 (or Pr 21.20). If the encoder phase angle is incorrect the drive may lose control of the motor resulting in an O.SPd or Enc10 trip when the drive is enabled.

With drive software version V01.04.00 and earlier, or when using software version V01.05.00 to V01.07.01 and Pr xx.00 set to 4yyy is used, then the encoder phase angles in Pr 3.25 and Pr 21.20 are not copied to the SMARTCARD. Therefore, Pr 3.25 and Pr 21.20 in the destination would not be changed during a transfer of this data block from the SMARTCARD.

## 11.21 Advanced features

This section gives information on some of the advanced functions of the drive. For additional information see the *Advanced User Guide*.

Reference modes	Pr <b>1.14</b> , Pr <b>1.15</b> and Pr <b>8.39</b>
Braking modes	Pr 2.04 and Pr 2.08
S ramps	Pr <b>2.06</b> and Pr <b>2.07</b>
Torque modes	Pr <b>4.08</b> and Pr <b>4.11</b>
Stop modes	Pr <b>6.01</b> , Pr <b>6.06</b> , Pr <b>6.07</b> and Pr <b>6.08</b>
Main loss modes	Pr <b>6.03</b> , Pr <b>6.48</b> , Pr <b>4.13</b> and Pr <b>4.14</b>
Start/stop logic modes	Pr <b>6.04</b> and Pr <b>6.40</b>
Catch a spinning motor	Pr <b>6.09</b> and Pr <b>5.40</b>
Position loop modes	Pr <b>13.10</b>
Fast disable	Pr <b>6.29</b>

#### 11.21.1 Reference modes

	1.1	4	Refere	ence s	elector					
R۱	Ν	Txt					NC		US	
<b>Û</b>	A1.		A1.Pr ( , PAd (4			$\Rightarrow$		A1.A2	(0)	

	1.1	15	Prese	t refere	nce se	lec	tor				
R۱	Ν	Uni						NC		US	
$\hat{\mathbf{v}}$	0 to 9					$\Diamond$			0		

	8.3	9	T28 ar	nd T29	auto-s	ele	ctio	n disal	ole		
R۱	Ν	Bit								US	
<b>Û</b>		OF	F (0) or	On (1)		$\Rightarrow$			OFF (	0)	

If Pr  $\bf 8.39$  is set to OFF (0), then the setting of Pr  $\bf 1.14$  automatically changes the operation of digital inputs T28 and T29 by configuring the destination parameters Pr  $\bf 8.25$  and Pr  $\bf 8.26$ . To allow Pr  $\bf 8.25$  and Pr  $\bf 8.26$  to be changed manually by the user, the automatic set-up must be disabled by setting Pr  $\bf 8.39$  to 1.

If Pr **8.39** is 0 and Pr **1.14** is changed, then a drive reset is required before the function of terminal T28 or T29 will become active.

#### Preset references

Preset references 1 to 8 are contained in Pr 1.21 to Pr 1.28.

#### **Keypad reference**

If Keypad reference is selected the drive sequencer is controlled directly by the keypad keys and the keypad reference parameter (Pr 1.17) is selected. The sequencing bits, Pr 6.30 to Pr 6.34, and Pr 6.37 have no effect and jog is disabled.

#### Precision reference

If Precision reference is selected the speed reference is given Pr 1.18 and Pr 1.19.

### 11.21.2 Braking Modes

	2.0	)4	Ramp	mode	select					
R۱	N	Txt							US	
OL	<b>Û</b>	F.	ASt (0) Std.h	•	),	$\Rightarrow$		Std (*	1)	
CL	Ť	F	ASt (0)	, Std (1	)			·		

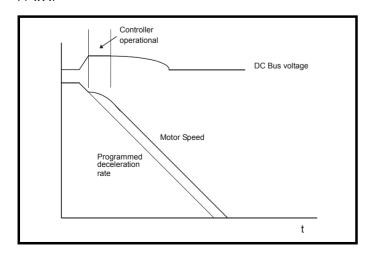

This parameter does not affect the acceleration ramp, as the ramp output always rises at the programmed acceleration rate subject to the current limits. It is possible in under some unusual circumstances in open-loop mode (i.e. highly inductive supply) for the motor to reach a low speed in standard ramp mode, but not completely stop. It is also possible if the drive attempts to stop the motor with an overhauling load in any mode that the motor will not stop when standard ramp mode or fast ramp mode is used. If the drive is in the deceleration state the rate of fall of the frequency or speed is monitored. If this does not fall for 10 seconds the drive forces the frequency or the speed reference to zero. This only applies when the drive is in the deceleration state and not when the reference is simply set to zero.

#### 0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits.

### 1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr 2.08) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr 2.08) is set lower than the nominal DC Bus level the drive will not decelerate the motor, but it will coast to rest. The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (Closed-loop vector or Servo modes). The gain of these controllers can be modified with Pr 4.13 and Pr 4.14.

#### 2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20%. This increases the losses in the motor giving faster deceleration.

	2.0	8	Stand	ard rar	np volt	age	)			
R۱	Ν	Uni		RA					US	
<b>\$</b>	D	C_VOL	0 to TAGE_		1AX V	⇧		400V 57	EUR> 7 JSA> 7 e: 895	

This voltage is used as the control level for standard ramp mode. If this parameter is set too low the machine will coast to rest, and if it is set too high and no braking resistor is used the drive may give an over-volt 'OV' trip. The minimum level should be greater than the voltage produced on the DC Bus by the highest supply voltage. Normally the DC Bus voltage will be approximately the rms supply line voltage x  $\sqrt{2}$ .

Care should be taken in the setting of this parameter. It is recommended that the setting should be at least 50V higher than the maximum expected level of the DC Bus voltage. If this is not done, the motor may fail to decelerate on a STOP command.

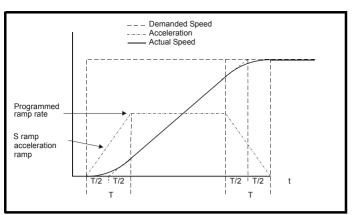

#### 11.21.3 S ramps

	2.0	16	S ram	p enab	le					
R۱	Ν	Bit							US	
Û		OFI	F (0) or	On (1)		$\Rightarrow$		OFF (	0)	

Setting this parameter enables the S ramp function. S ramp is disabled during deceleration using standard ramp. When the motor is accelerated again after decelerating in standard ramp the acceleration ramp used by the S ramp function is reset to zero.

	2.0	7	S ram	р ассе	leratio	n lir	nit			
R۱	N	Uni							US	
OL	•		0.0 to s <sup>2</sup> /10	300.0 00Hz				3.1		
VT	Û	0	.000 to		00	⇔		1.50	0	
sv			s <sup>2</sup> /100	00rpm				0.03	0	

This parameter defines the maximum rate of change of acceleration/ deceleration. The default values have been chosen such that for the default ramps and maximum speed, the curved parts of the S will be 25% of the original ramp if S ramp is enabled.

Since the ramp rate is defined in s/100Hz or s/1000rpm and the S ramp parameter is defined in s $^2$ /100Hz or s $^2$ /1000rpm, the time T for the 'curved' part of the S can be determined from:

#### T = S ramp rate of change / Ramp rate

Enabling S ramp increases the total ramp time by the period T since an additional T/2 is added to each end of the ramp in producing the S.

## 11.21.4 Torque modes

	4.0	)8	e refer	ence						
R۷	W Bi								US	
<b>Û</b>	±USER_CURRENT_MAX %					$\Rightarrow$		0.00	)	

Parameter for main torque reference. The normal update rate for the torque reference is 4ms. However if analog inputs 2 or 3 on the drive are used as the source of the reference, the drive is in closed-loop vector or servo mode and the analog inputs are in voltage mode with zero offset, the sample time is reduced to  $250\mu s$ .

	4.1	11	Torqu	e mod	le selec	tor				
R۱	Ν	Uni							US	
OL	℩		0 t	o 1		U C		0		
CL	*		0 t	o 4				Ū		

#### Open loop

If this parameter is 0 normal frequency control is used. If this parameter is set to 1 the current demand is connected to the current PI controller giving closed loop torque/current demand as shown below. The current error is passed through proportional and integral terms to give a frequency reference which is limited to the range: -SPEED\_FREQ\_MAX to +SPEED\_FREQ\_MAX.

#### Closed loop vector and Servo

When this parameter is set to 1, 2 or 3 the ramps are not active while the drive is in the run state. When the drive is taken out of the run state, but not disabled, the appropriate stopping mode is used. It is recommended that coast stopping or stopping without ramps are used. However, if ramp stop mode is used the ramp output is pre-loaded with the actual speed at the changeover point to avoid unwanted jumps in the speed reference.

#### 0: Speed control mode

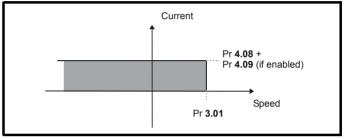

The torque demand is equal to the speed loop output.

#### 1: Torque control

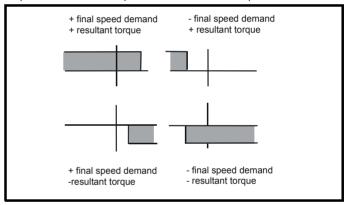

The torque demand is given by the sum of the torque reference and the torque offset, if enabled. The speed is not limited in any way, however, the drive will trip at the overspeed threshold if runaway occurs

#### 2: Torque control with speed override

The output of the speed loop defines the torque demand, but is limited between 0 and the resultant torque reference (Pr **4.08** and Pr **4.09** (if enabled)). The effect is to produce an operating area as shown below if the final speed demand and the resultant torque reference are both positive. The speed controller will try and accelerate the machine to the final speed demand level with a torque demand defined by the resultant torque reference. However, the speed cannot exceed the reference because the required torque would be negative, and so it would be clamped to zero.

Depending on the sign of the final speed demand and the resultant torque the four areas of operation shown below are possible.

This mode of operation can be used where torque control is required, but the maximum speed must be limited by the drive.

## 3: Coiler/uncoiler mode

Positive final speed demand:

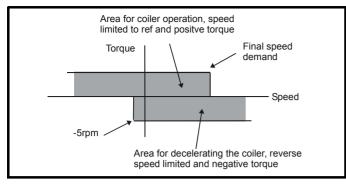

A positive resultant torque will give torque control with a positive speed limit defined by the final speed demand. A negative resultant torque will give torque control with a negative speed limit of -5rpm.

#### Negative final speed demand:

A negative resultant torque will give torque control with a negative speed limit defined by the final speed demand. A positive resultant torque will give torque control with a positive speed limit of +5rpm.

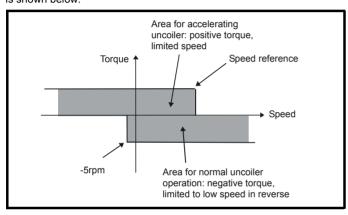

#### Example of coiler operation:

This is an example of a coiler operating in the positive direction. The final speed demand is set to a positive value just above the coiler reference speed. If the resultant torque demand is positive the coiler operates with a limited speed, so that if the material breaks the speed does not exceed a level just above the reference. It is also possible to decelerate the coiler with a negative resultant torque demand. The coiler will decelerate down to -5rpm until a stop is applied. The operating area is shown in the following diagram.

#### Example of uncoiler operation:

This is an example for an uncoiler operating in the positive direction. The final speed demand should be set to a level just above the maximum normal speed. When the resultant torque demand is negative the uncoiler will apply tension and try and rotate at 5rpm in reverse, and so take up any slack. The uncoiler can operate at any positive speed applying tension. If it is necessary to accelerate the uncoiler a positive resultant torque demand is used. The speed will be limited to the final speed demand. The operating area is the same as that for the coiler and is shown below:

#### 4: Speed control with torque feed-forward

The drive operates under speed control, but a torque value may be added to the output of the speed controller. This can be used to improve the regulation of systems where the speed loop gains need to be low for stability.

## 11.21.5 Stop modes

	6.0	)1	Stop n	node							
R۱	Ν	Txt		US							
OL	<b>\$</b>		St (0), r dcl (3) diSAb	td.dcl		₽			rP (1	)	
VT	*	C	COASt (0), rP (1),								
sv		no.rP (2)							no.rP	(2)	

## Open-loop

Stopping is in two distinct phases: decelerating to stop, and stopped.

Stopping			
Mode	Phase 1	Phase 2	Comments
0: Coast	Inverter disabled	Drive cannot be re-enabled for 1s	Delay in phase 2 allows rotor flux to decay
1: Ramp	Ramp down to zero frequency	Wait for 1s with inverter enabled	
2: Ramp followed by DC injection	Ramp down to zero frequency	Inject DC at level specified by Pr <b>6.06</b> for time defined by Pr <b>6.07</b>	
3: DC injection with zero speed detection	Low frequency current injection with detection of low speed before next phase	Inject DC at level specified by Pr 6.06 for time defined by Pr 6.07	The drive automatically senses low speed and therefore it adjusts the injection time to suit the application. If the injection current level is too small the drive will not sense low speed (normally a minimum of 50-60% is required).
4: Timed DC injection braking stop	Inject DC at level specified by Pr 6.06 for time specified by Pr 6.07		
5: Disable	Inverter disabled		Allows the drive to be immediately disabled and then re-enabled again immediately if required.

Once modes 3 or 4 have begun the drive must go through the ready state before being restarted either by stopping, tripping or being disabled.

If this parameter is set to DiASbLE (5), the disable stopping mode is used when the run command is removed. This mode will allow the drive to be started immediately by re-applying the run command. However, if the drive is disabled by removing the drive enable (i.e. via the Enable SAFE TORQUE OFF input or Pr 6.15 Drive enable) then the drive cannot be re-enabled for 1s.

#### Closed loop vector and Servo

Only one stopping phases exists and the ready state is entered as soon as the single stopping action is complete.

Stopping Mode	Action
0: Coast	Inhibits the inverter
1: Ramp	Stop with ramp
2: No ramp	Stop with no ramp

The motor can be stopped with position orientation after stopping. This mode is selected with the position controller mode parameter (Pr 13.10). When this mode is selected Pr 6.01 has no effect.

6.0	)6	Injection braking level								
RW	Uni						RA		US	
OL Û	0.0 to 150.0 %				$\Box$			100.0	0	

Defines the current level used during DC injection braking as a percentage of motor rated current as defined by Pr **5.07**.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running		SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

	6.0	)7	Injection braking time									
RW Uni										US		
OL	<b>Û</b>	0.0 to 25.0 s				$\Diamond$			1.0			

Defines the time of injection braking during phase 1 with stopping modes 3 and 4, and during phase 2 with stopping mode 2 (see Pr 6.01).

	6.08 Hold zero speed									
R۱	Ν	Bit							US	
OL								OFF (	<b>0</b> )	
VT	${\mathfrak J}$	0	OFF (0) or On (1)	⇨		011 (	0)			
sv								On (1	1)	

When this bit is set the drive remains active even when the run command has been removed and the motor has reached standstill. The drive goes to the 'StoP' state instead of the 'rdy' state.

## 11.21.6 Line power supply loss modes

	6.0	)3	Line power supply loss mode									
R۷	W Txt									US		
<b>Û</b>	diS (0), StoP (1), ridE.th (2)					$\qquad \qquad $			diS (0	0)		

### 0: diS

There is no line power supply loss detection and the drive operates normally only as long as the DC bus voltage remains within specification (i.e. >Vuu). Once the voltage falls below Vuu an under-voltage 'UV' trip occurs. This will reset itself if the voltage rises above Vuu Restart, as stated in the table below.

#### 1: StoP - Open-loop

The action taken by the drive is the same as for ride through mode, except the ramp down rate is at least as fast as the deceleration ramp setting and the drive will continue to decelerate and stop even if the line power supply is re-applied. If normal or timed injection braking is selected the drive will use ramp mode to stop on loss of the supply. If ramp stop followed by injection braking is selected, the drive will ramp to a stop and then attempt to apply dc injection. At this point, unless the line power supply has been restored, the drive is likely to initiate a trip.

#### 1: StoP - Closed-loop vector or Servo

The speed reference is set to zero and the ramps are disabled allowing the drive to decelerate the motor to a stop under current limit. If the Line power supply is re-applied while the motor is stopping any run signal is ignored until the motor has stopped. If the current limit value is set very low level the drive may trip UV before the motor has stopped.

#### 2: ridE.th

The drive detects line power supply loss when the DC bus voltage falls below  $\text{Vml}_1.$  The drive then enters a mode where a closed-loop controller attempts to hold the DC bus level at  $\text{Vml}_1.$  This causes the motor to decelerate at a rate that increases as the speed falls. If the line power supply is re-applied it will force the DC bus voltage above the detection threshold  $\text{Vml}_3$  and the drive will continue to operate normally. The output of the line power supply loss controller is a current demand that is fed into the current control system and therefore the gain Pr **4.13** and Pr **4.14** must be set up for optimum control. See parameters Pr **4.13** and Pr **4.14** for set-up details.

The following table shows the voltage levels used by drives with each voltage rating.

Voltage level	200V drive	400V drive	575V drive	690V drive
Vuu	175	330	43	35
VmI <sub>1</sub>	205*	410*	54	0*
Vml <sub>2</sub>	Vml <sub>1</sub> - 10V	VmI <sub>1</sub> - 20V	Vml <sub>1</sub>	- 25V
Vml <sub>3</sub>	VmI <sub>1</sub> + 10V	VmI <sub>1</sub> + 15V	Vml <sub>1</sub>	+ 50V
Vuu Restart	215	425	59	90

\* Vml<sub>1</sub> is defined by Pr **6.48**. The values in the table above are the default values.

ı		6.48 RW Uni		Line power supply				s ric	de thro	ugh de	tection	level
ı	R۷	٧	Uni						RA		US	
	<b>\$</b>	DO	C_VOL	0 to		1AX V	⇧		40 57	0V driv 0V driv 5V driv 0V driv	e: 410 e: 540	

The line power supply loss detection level can be adjusted using this parameter. If the value is reduced below the default value, the default value is used by the drive. If the level is set too high, so that the line power supply loss detection becomes active under normal operating conditions, the motor will coast to a stop.

	4.1	3	Current loop P gain

CL	<b>\$</b>		0 to 30,000					400 575	)V drive )V drive 5V drive )V drive	2,000 2,400		

#### Open-loop

These parameters control the proportional and integral gains of the current controller used in the open loop drive. As already mentioned the current controller either provides current limits or closed loop torque control by modifying the drive output frequency. The control loop is also used in its torque mode during line power supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive. Although the default settings have been chosen to give suitable gains for less demanding applications it may be necessary for the user to adjust the performance of the controller. The following is a guide to setting the gains for different applications.

#### Current limit operation:

The current limits will normally operate with an integral term only, particularly below the point where field weakening begins. The proportional term is inherent in the loop. The integral term must be increased enough to counter the effect of the ramp which is still active even in current limit. For example, if the drive is operating at constant frequency and is overloaded the current limit system will try to reduce the output frequency to reduce the load.

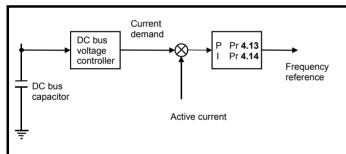

At the same time the ramp will try to increase the frequency back up to the demand level. If the integral gain is increased too far the first signs of instability will occur when operating around the point where field weakening begins. These oscillations can be reduced by increasing the proportional gain. A system has been included to prevent regulation because of the opposite actions of the ramps and the current limit. This can reduce the actual level that the current limit becomes active by 12.5%. This still allows the current to increase up to the current limit set by the user. However the current limit flag (Pr 10.09) could become active up to 12.5% below the current limit depending on the ramp rate used.

#### Torque control:

Again the controller will normally operate with an integral term only, particularly below the point where field weakening begins. The first signs of instability will appear around base speed, and can be reduced by increasing the proportional gain. The controller can be less stable in torque control mode rather than when it is used for current limiting. This is because load helps to stabilise the controller, and under torque control the drive may operate with light load. Under current limit the drive is often under heavy load unless the current limits are set at a low level.

Line power supply loss and controlled standard ramp:

The DC bus voltage controller becomes active if line power supply loss detection is enabled and the drive supply is lost or controlled standard ramp is being used and the machine is regenerating. The DC bus controller attempts to hold the DC bus voltage at a fixed level by controlling the flow of current from the drive inverter into its DC bus capacitors. The output of the DC bus controller is a current demand which is fed into the current PI controller as shown in the following diagram.

Although it is not usually necessary the DC bus voltage controller can be adjusted with Pr **5.31**. However, it may often be necessary to adjust the current controller gains to obtain the required performance. If the gains are not suitable it is best to set up the drive in torque control first. Set the gains to a value that does not cause instability around the point at which field weakening occurs. Then revert back to open loop speed control in standard ramp mode. To test the controller the supply should be removed while the motor is running. It is likely that the gains can be increased further if required because the DC bus voltage controller has a stabilising effect, provided that the drive is not required to operate in torque control mode.

## **Closed-loop vector and Servo**

The Kp and Ki gains are used in the voltage based current controller. The default values give satisfactory operation with most motors. However it may be necessary to change the gains to improve the performance. The proportional gain (Pr **4.13**) is the most critical value in controlling the performance. Either the value can be set by auto-tuning (see Pr **5.12**) or it can be set by the user so that

$$Pr 4.13 = Kp = (L / T) x (I_{fs} / V_{fs}) x (256 / 5)$$

#### Where

T is the sample time of the current controllers. The drive compensates for any change of sample time, and so it should be assumed that the sample time is equivalent to the lowest sample rate of  $167\mu s$ .

L is the motor inductance. For a servo motor this is half the phase to phase inductance that is normally specified by the manufacturer. For an induction motor this is the per phase transient inductance  $(\sigma L_s)$ . This is the inductance value stored in Pr **5.24** after the autotune test is carried out. If  $\sigma L_s$  cannot be measured it can be calculated from the steady state per-phase equivalent circuit of the motor as follows:

$$\sigma L_{s} = L_{s} - \left(\frac{L_{m}^{2}}{L_{r}}\right)$$

 $I_{fs}$  is the peak full scale current feedback =  $K_C \times \sqrt{2} / 0.45$ 

Where  $K_C$  is defined in Table 11-5.

V<sub>fs</sub> is the maximum DC Bus voltage.

#### Therefore:

Pr 4.13 = Kp = (L / 167
$$\mu$$
s) x (K<sub>C</sub> x  $\sqrt{2}$  / 0.45 / V<sub>fs</sub>) x (256 / 5) = K x L x K<sub>C</sub>

Where

$$K = [\sqrt{2} / (0.45 \times V_{fs} \times 167 \mu s)] \times (256 / 5)$$

Drive voltage rating	Vfs	K
200V	415V	2322
400V	830V	1161
575V	990V	973
690V	1190V	809

This set-up will give a step response with minimum overshoot after a step change of current reference. The approximate performance of the current controllers will be as given below. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth, however, this gives at step response with approximately 12.5% overshoot.

	Switching frequency kHz	Current control sample time μs	Gain bandwidth Hz	Phase delay μs
ľ	3	167	TBA	1160
ľ	4	125	TBA	875
ľ	6	83	TBA	581
ľ	8	125	TBA	625
ľ	12	83	TBA	415
I	16	125	TBA	625

The integral gain (Pr 4.14) is less critical and should be set so that

Pr **4.14** = Ki = **Kp** x **256** x **T** / 
$$\tau_{m}$$

Where

 $\tau_{m}$  is the motor time constant (L / R).

R is the per phase stator resistance of the motor (i.e. half the resistance measured between two phases).

Therefore

Pr 4.14 = Ki = (K x L x K<sub>C</sub>) x 256 x 167
$$\mu$$
s x R / L  
= 0.0427 x K x R x K<sub>C</sub>

The above equation gives a conservative value of integral gain. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed closed-loop induction motor applications) the integral gain may need to have a significantly higher value.

+	programmable	programmable	programmable	programmable

If Pr 6.04 has been set to a value of 0 to 3, then setting Pr 6.04 to 4 does not automatically reconfigure terminals T25, T26 and T27 to their default functions. To return terminals T25, T26 and T27 to their default functions, one of the following operations should be performed.

- Drive defaults should be restored. See section 5.8 Restoring parameter defaults on page 83 for details.
- Manually set Pr 6.04 to 4, Pr 6.40 to 0, Pr 8.22 to 10.33, Pr 8.23 to 6.30, and Pr 8.24 to 6.32.

Figure 11-47 Digital input connections when Pr 6.04 is set to 0 to 3

This parameter enables sequencer latching. When sequencer latching is used, a digital input must be used as a run permit or not stop input. The digital input should write to Pr **6.39**. The run permit or not stop input must be made active to allow the drive to run. Making the run permit or not stop input inactive resets the latch and stops the drive.

#### 11.21.8 Catch a spinning motor

	6.0	9	Catch	a spir	nning m	oto	r			
R۱	N	Uni							US	
OL	⇧		0 to 3					0		
CL	❖	0 to 1						1		

#### Open-loop

When the drive is enabled with this parameter at zero, the output frequency starts at zero and ramps to the required reference. When the drive is enabled with this parameter at a non-zero value, the drive performs a start-up test to determine the motor speed and then sets the initial output frequency to the synchronous frequency of the motor.

The test is not carried out and the motor frequency starts at zero if one of the following is true.

- The run command is given when the drive is in the stop state
- The drive is first enabled after power-up with Ur I voltage mode (Pr 5.14 = Ur I).
- The run command is given with Ur\_S voltage mode (Pr 5.14 = Ur S).

With default parameters the length of the test is approximately 250ms. however, if the motor has a long rotor time constant (usually large motors) it may be necessary to extend the test time. The drive will do this automatically if the motor parameters including the rated load rpm are set up correctly for the motor.

For the test to operate correctly it is important that the stator resistance (Pr 5.17 or Pr 21.12) is set up correctly. This applies even if fixed boost (Pr 5.14 = Fd) or square law (Pr 5.14 = SrE) voltage mode is being used. The test uses the rated magnetizing current of the motor during the test, therefore the rated current (Pr 5.07, Pr 21.07 and Pr 5.10, Pr 21.10) and power factor should be set to values close to those of the motor. although these parameters are not as critical as the stator resistance. For larger motors it may be necessary to increase Pr 5.40 Spin start boost from its default value of 1.0 for the drive to successfully detect the motor speed.

It should be noted that a stationary lightly loaded motor with low inertia might move slightly during the test. The direction of the movement is undefined. Restrictions may be placed on the direction of this movement and on the frequencies detected by the drive as follows:

Pr 6.09	Function
0	Disabled
1	Detect all frequencies
2	Detect positive frequencies only
3	Detect negative frequencies only

#### Closed-loop vector and Servo

When the drive is enabled with this bit at zero, the post ramp reference (Pr 2.01) starts at zero and ramps to the required reference. When the drive is enabled with this bit at one, the post ramp reference is set to the motor speed.

When closed-loop vector mode is used without position feedback, and catch a spinning motor is not required, this parameter should be set to zero as this avoids unwanted movement of the motor shaft when zero speed is required. When closed-loop vector mode without position feedback is used with larger motors it may be necessary to increase Pr 5.40 Spin start boost from its default value of 1.0 for the drive to successfully detect the motor speed.

	5.4	10	Spin s	tart bo	ost					
R۱	Ν	Uni							US	
OL	î	0.0 to 10.0				仓		1.0		
VT	·	0.0 to 10.0				ĺ		1.0		

If Pr 6.09 is set to enable the catch a spinning motor function in openloop mode or closed-loop vector mode without position feedback, (Pr 3.24 = 1 or 3) this parameter defines a scaling function used by the algorithm that detects the speed of the motor. It is likely that for smaller motors the default value of 1.0 is suitable, but for larger motors this parameter may need to be increased. If the value of this parameter is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.

#### 11.21.9 **Position modes**

	13.	10	Position controller mode								
R۱	W	Uni								US	
OL	⇧		0 t	0 2		Û			0		
CL	₩		0 to 6						0		

This parameter is used to set the position controller mode as shown in the table below.

Parameter value	Mode	Feed forward active
0	Position controller disabled	
1	Rigid position control	✓
2	Rigid position control	
3	Non-rigid position control	✓
4	Non-rigid position control	
5	Orientation on stop	
6	Orientation on stop and when drive enabled	

#### Rigid position control

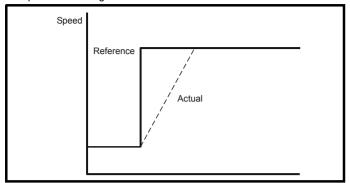

In rigid position control the position error is always accumulated. This means that, if for example, the slave shaft is slowed down due to excessive load, the target position will eventually be recovered by running at a higher speed when the load is removed.

Safety Product Mechanica SMARTCARD Advanced **UL** Listing Optimization Diagnostics information information installation Installation started parameters the moto operation PLC information

#### Non-rigid position control

In non-rigid position control the position loop is only active when the 'At Speed' condition is met (see Pr **3.06**). This allows slippage to occur while the speed error is high.

#### Velocity feed forward

The position controller can generate a velocity feed forwards value from the speed of the reference encoder. The feed-forwards value is passed to menu, and so ramps may be included if required. Because the position controller only has a proportional gain, it is necessary to use velocity feed-forwards to prevent a constant position error that would be proportional to the speed of the reference position.

If for any reason the user wishes to provide the velocity feed forward from a source other than the reference position, the feed forward system can be made inactive, i.e. Pr **13.10** = 2 or 4. The external feed forward can be provided via Menu 1 from any of the frequency/speed references. However, if the feed forward level is not correct a constant position error will exist.

#### Relative jogging

If relative jogging is enabled the feedback position can be made to move relative the reference position at the speed defined by Pr **13.17**.

#### Orientation

If Pr 13.10 is 5 the drive orientates the motor following a stop command. If hold zero speed is enabled (Pr 6.08 = 1) the drive remains in position control when orientation is complete and hold the orientation position. If hold zero speed is not enabled the drive is disabled when orientation is complete.

If Pr **13.10** is 6 the drive orientates the motor following a stop command and whenever the drive is enabled provided that hold zero speed is enabled (Pr **6.08** = 1). This ensures that the spindle is always in the same position following the drive being enabled.

When orientating from a stop command the drive goes through the following sequence:

- The motor is decelerated or accelerated to the speed limit programmed in Pr 13.12, using ramps if these are enabled, in the direction the motor was previously running.
- When the ramp output reaches the speed set in Pr 13.12, ramps are disabled and the motor continues to rotate until the position is found to be close to the target position (i.e. within 1/32 of a revolution). At this point the speed demand is set to 0 and the position loop is closed.
- When the position is within the window defined by Pr 13.14, the orientation complete indication is given in Pr 13.15.

The stop mode selected by Pr **6.01** has no effect if orientation is enabled.

# 11.21.10 Fast Disable Software V01.10.00 and later

	6.2	9	Hardw	are en	able				
RO	O Bit						NC	PT	
<b>Û</b>	OFF (0) or On (1)					$\Rightarrow$			

This bit is a duplicate of Pr **8.09** and reflects the state of the enable input. With software V01.10.00 and later, if the destination of one of the drive digital I/O (Pr **8.21** to Pr **8.26**) is set to Pr **6.29** and the I/O is set as an input, the state of the input does not affect the value of this parameter as it is protected, however, it does provide a fast disable function.

The SAFE TORQUE OFF input to the drive (T31) disables the drive in hardware by removing the gate drive signals from the inverter IGBT's and also disables the drive via the software system. When the drive is disabled by de-activating the SAFE TORQUE OFF input (T31) there can be a delay of up to 20ms (typically 8ms) before the drive is disabled. However, if a digital I/O is set up to provide the fast disable function it is possible to disable the drive within  $600\mu s$  of de-activating the input. To do this an enable signal should be given to both the SAFE TORQUE OFF input (T31) and to the digital I/O selected for the fast disable function. The state of the digital I/O including the effect of its associated invert parameter is ANDed with the SAFE TORQUE OFF (T31) to enable the drive

If the safety function of the SAFE TORQUE OFF input is required then there must not be a direct connection between the SAFE TORQUE OFF input (T31) and any other digital I/O on the drive. If the safety function of the SAFE TORQUE OFF input and the fast disable function is required then the drive should be given two separate independent enable signals. A safety related enable from a safe source connected to the SAFE TORQUE OFF input on the drive. A second enable connected to the digital I/O on the drive selected for the fast disable function. The circuit must be arranged so that a fault which causes the fast input to be forced high, including the case where a component such as a blocking diode has failed.

## 12.1.3 Supply requirements

Voltage:

SPX4XX 380V to 480V ±10% SPX6XX 500V to 690V ±10%

Number of phases: 3

Maximum supply imbalance: 2% negative phase sequence (equivalent to 3% voltage imbalance between phases).

Frequency range: 48 to 65 Hz

For UL compliance only, the maximum supply symmetrical fault current must be limited to 100kA

## 12.1.4 Motor requirements

No. of phases: 3 Maximum voltage:

Unidrive SP (400V): 480V Unidrive SP (690V): 690V

## 12.1.5 Temperature, humidity and cooling method

Ambient temperature operating range:

0°C to 50°C (32°F to 122°F).

Output current derating must be applied at ambient temperatures >40°C (104°F).

Minimum temperature at power-up:

-15°C (5°F), the supply must be cycled when the drive has warmed up to 0°C (32°F).

Cooling method: Forced convection

Maximum humidity: 95% non-condensing at 40°C (104°F)

## 12.1.6 Storage

-40°C (-40°F) to +50°C (122°F) for long term storage, or to +70°C (158°F) for short term storage.

Electrolytic capacitors in any electronic product have a storage period after which they require reforming or replacing.

The DC bus capacitors have a storage period of 10 years.

The low voltage capacitors on the control supplies typically have a storage period of 2 years and are thus the limiting factor.

Low voltage capacitors cannot be reformed due to their location in the circuit and thus may require replacing if the drive is stored for a period of 2 years or greater without power being applied.

It is therefore recommended that drives are powered up for a minimum of 1 hour after every 2 years of storage.

This process allows the drive to be stored for a further 2 years.

#### 12.1.7 Altitude

Altitude range: 0 to 3,000m (9,900 ft), subject to the following conditions:

1,000m to 3,000m (3,300 ft to 9,900 ft) above sea level: de-rate the maximum output current from the specified figure by 1% per 100m (330 ft) above 1,000m (3,300 ft)

For example at 3,000m (9,900ft) the output current of the drive would have to be de-rated by 20%.

## 12.1.8 IP / UL Rating

The Unidrive SP Free Standing drive is rated to IP21 pollution degree 2 (dry, non-conductive contamination only) (NEMA 1). An IP23 option is also available.

The IP rating of a product is a measure of protection against ingress and contact to foreign bodies and water. It is stated as IP XX, where the two digits (XX) indicate the degree of protection provided as shown in Table 12-6.

Table 12-6 IP Rating degrees of protection

	First digit		Second digit
	otection against contact and gress of foreign bodies	Pr	otection against ingress of water
0	No protection	0	No protection
1	Protection against large foreign bodies φ > 50mm (large area contact with the hand)	1	Protection against vertically falling drops of water
2	Protection against medium size foreign bodies $\phi > 12$ mm (finger)	2	Protection against spraywater (up to 15° from the vertical)
3	Protection against small foreign bodies φ > 2.5mm (tools, wires)	3	Protection against spraywater (up to 60° from the vertical)
4	Protection against granular foreign bodies φ > 1mm (tools, wires)	4	Protection against splashwater (from all directions)
5	Protection against dust deposit, complete protection against accidental contact.	5	Protection against heavy splash water (from all directions, at high pressure)
6	Protection against dust ingress, complete protection against accidental contact.	6	Protection against deckwater (e.g. in heavy seas)
7		7	Protection against immersion
8		8	Protection against submersion

Safety	Product	Mechanical	Electrical	Getting	Basic	Running		SMARTCARD	Onboard	Advanced	Technical	Diagnostics	UL Listing
information	information	installation	Installation	started	parameters	the motor	Optimization	operation	PLC	parameters	data	Diagnostics	information

Table 12-7 UL enclosure ratings

UL rating	Description
Type 1	Enclosures are intended for indoor use, primarily to provide a degree of protection against limited amounts of falling dirt.

#### 12.1.9 Corrosive gasses

Concentrations of corrosive gases must not exceed the levels given in:

- Table A2 of EN 50178:1998
- Class 3C2 of IEC 60721-3-3

This corresponds to the levels typical of urban areas with industrial activities and/or heavy traffic, but not in the immediate neighborhood of industrial sources with chemical emissions.

#### 12.1.10 Vibration

Maximum recommended continuous vibration level 0.14 g r.m.s. broadband 5 to 200 Hz.

#### NOTE

This is the limit for broad-band (random) vibration. Narrow-band vibration at this level which coincides with a structural resonance could result in premature failure.

#### 12.1.11 Starts per hour

By electronic control: unlimited

By interrupting the AC supply: ≤20 (equally spaced)

#### 12.1.12 Start up time

This is the time taken from the moment of applying power to the drive, to the drive being ready to run the motor:

All sizes: 9 s

## 12.1.13 Output frequency / speed range

Open-loop frequency range: 0 to 550 Hz Closed-loop speed range: 0 to 40,000rpm Closed-loop frequency range: 0 to 550 Hz\* \*(Limit to ~500 Hz for good performance)

## 12.1.14 Accuracy and resolution

## Speed:

The absolute frequency and speed accuracy depends on the accuracy of the crystal used with the drive microprocessor. The accuracy of the crystal is 100ppm, and so the absolute frequency/speed accuracy is 100ppm (0.01%) of the reference, when a preset speed is used. If an analog input is used the absolute accuracy is further limited by the absolute accuracy of the analog input.

The following data applies to the drive only; it does not include the performance of the source of the control signals.

Open loop resolution:

Preset frequency reference: 0.1Hz
Precision frequency reference: 0.001Hz

Closed loop resolution

Preset speed reference: 0.1rpm
Precision speed reference: 0.001rpm
Analog input 1: 16bit plus sign
Analog input 2: 10bit plus sign

#### **Current:**

The resolution of the current feedback is 10bit plus sign. The typical accuracy of the current feedback is typically 0% and worst case 5%.

### 12.1.15 Roof fan

Roof mounted fans are only fitted in the following Unidrive SP Free Standing drives.

Table 12-8 Roof mounted fans

Model	Roo	f Fan

SP9XX4	Not Fitted	2 x Fitted				
SP9XX5	2 x Fitted	2 x Fitted				

### 12.1.16 Acoustic noise

The cooling fans generate the majority of the acoustic noise produced by the drive. The power modules in the drive contain cooling fans. The power modules control the speed at which the fans run at based on the temperature of the power modules and the drive's thermal model system. The SP8414 and SP9415 contain an additional fan at the top of the enclosure(s) which is a single speed fan which runs whenever the drive is powered up.

Table 12-9 gives the acoustic noise produced by the drive for the heatsink fan running at the maximum and minimum speeds.

Table 12-9 Acoustic noise data for Free Standing drives

Size	Max speed dBA	Min speed dBA
6	72	43
7	70*	
8	70*	57*
9	73	60

<sup>\*</sup>These figures are worst case as they include some low level background noise due to the location of the measurement.

## 12.1.19 Input current, fuse and cable size ratings

The input current is affected by the supply voltage and impedance.

#### Typical input current

The values of typical input current are given to aid calculations for power flow and power loss.

The values of typical input current are stated for a balanced supply.

#### Maximum continuous input current

The values of maximum continuous input current are given to aid the selection of cables and fuses. These values are stated for the worst case condition with the unusual combination of stiff supply with bad balance.

The value stated for the maximum continuous input current would only be seen in one of the input phases. The current in the other two phases would be significantly lower.

The values of maximum input current are stated for a supply with a 2% negative phase-sequence imbalance and rated at the maximum supply fault current given in Table 12-12.

Table 12-12 Supply fault current used to calculate maximum input currents

Model	Symmetrical fault level (kA)
All	100

### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for cable installation method B2 (multicore cable in conduit).

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

#### Fuses

The AC supply to the drive must be installed with suitable protection against overload and short-circuits. Table 12-13 and Table 12-14 show recommended fuse ratings. Failure to observe this requirement will cause risk of fire.

Key to t	Key to the cable installation method (ref: IEC60364-5-52:2001)							
B1	Separate Cables in Conduit							
B2	Multi-core cable in conduit							
С	Multi-core cable in free-air							
Е	On perforated tray							
F	Separate cables bunched in groups of three, in free air							
G	Individual cables separated vertically in free air							

#### NOTE

Cable sizes are from IEC60364-5-52:2001 table A.52.C with correction factor for 40°C ambient of 0.87 (from table A52.14) for above cable installation methods.

Cable size may be reduced if a different installation method is used, or if the ambient temperature is lower.

The recommended cable sizes above are only a guide. The mounting and grouping of cables affects their current-carrying capacity, in some cases smaller cables may be acceptable but in other cases a larger cable is required to avoid excessive temperature or voltage drop. Refer to local wiring regulations for the correct size of cables.

The Semiconductor IEC class aR fuses for size 8 and 9 drives must be installed within the enclosure section 3.4 *Installing fuses in a Free Standing drive* on page 29. These parts may be bought from Control Techniques, see Table 12-15.

IEC61800-3 Product standard for adjustable speed power drive systems (immunity requirements)			Meets immunity requirements for first and second environments		

See Surge immunity of control circuits - long cables and connections outside a building on page 69 for control ports for possible requirements regarding grounding and external surge protection

#### **Emission**

The drive contains an in-built filter for basic emission control. An additional optional external filter provides further reduction of emission. The requirements of the following standards are met, depending on the motor cable length and switching frequency.

Key (shown in decreasing order of permitted emission level):

EN 61800-3:2004 second environment, restricted distribution (Additional measures may be required to prevent interference)

E2U EN 61800-3:2004 second environment, unrestricted distribution ı Industrial generic standard EN 61000-6-4:2007 EN 61800-3:2004 first environment restricted distribution (The following caution is required by EN 61800-3:2004)

This is a product of the restricted distribution class according to IEC 61800-3. In a residential environment this product may cause radio interference in which case the user may be required to take adequate measures.

R Residential generic standard EN 61000-6-3:2007 EN 61800-3:2004 first environment unrestricted distribution

EN 61800-3:2004 defines the following:

- The first environment is one that includes residential premises. It also includes establishments directly connected without intermediate transformers to a low-voltage power supply network which supplies buildings used for residential purposes.
- The second environment is one that includes all establishments other than those directly connected to a low-voltage power supply network which supplies buildings used for residential purposes.
- Restricted distribution is defined as a mode of sales distribution in which the manufacturer restricts the supply of equipment to suppliers, customers or users who separately or jointly have technical competence in the EMC requirements of the application of

#### IEC 61800-3:2004 and EN 61800-3:2004

The 2004 revision of the standard uses different terminology to align the requirements of the standard better with the EC EMC Directive.

Power drive systems are categorized C1 to C4:

Category	Definition	Corresponding code used above
C1	Intended for use in the first or second environments	R
C2	Not a plug-in or movable device, and intended for use in the first environment only when installed by a professional, or in the second environment	I
C3	Intended for use in the second environment, not the first environment	E2U
C4	Rated at over 1000V or over 400A, intended for use in complex systems in the second environment	E2R

Note that category 4 is more restrictive than E2R, since the rated current of the PDS must exceed 400A or the supply voltage exceed 1000V, for the complete PDS.

# 13 Diagnostics

The display on the drive gives various information about the status of the drive. These fall into three categories:

- Trip indications
- · Alarm indications
- · Status indications

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter.

If a drive is faulty, it must be returned to an authorized WARNING Control Techniques distributor for repair.

### 13.1 Trip indications

If the drive trips, the output of the drive is disabled so that the drive stops controlling the motor. The upper display indicates that a trip has occurred and the lower display shows the trip. If this is a multi-module drive and a power module has indicated a trip, then the lower display will alternate between the trip string and the module number.

Trips are listed alphabetically in Table 13-1 based on the trip indication shown on the drive display. Refer to Figure 13-1.

If a display is not used, the drive LED Status indicator will flash if the drive has tripped. Refer to Figure 13-2.

The trip indication can be read in Pr **10.20** providing a trip number. Trip numbers are listed in numerical order in Table 13-2 so the trip indication can be cross referenced and then diagnosed using Table 13-1.

### **Example**

- 1. Trip code 3 is read from Pr 10.20 via serial communications.
- 2. Checking Table 13-2 shows Trip 3 is an OI.AC trip.

- 3. Look up OI.AC in Table 13-1.
- 4. Perform checks detailed under Diagnosis.

### Figure 13-1 Keypad status modes

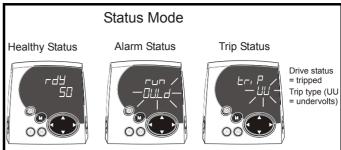

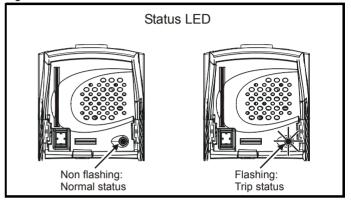

Figure 13-2 Location of the status LED

Trip	Diagnosis
OI.AC	Instantaneous output over current detected: peak output current greater than 225%
	Acceleration / deceleration rate is too short.  If seen during autotune reduce voltage boost Pr <b>5.15</b> Check for short circuit on output cabling
•	Check integrity of motor insulation Check feedback device wiring Check feedback device mechanical coupling
3	Check feedback signals are free from noise Is motor cable length within limits for that frame size? Reduce the values in speed loop gain parameters – Pr <b>3.10</b> , Pr <b>3.11</b> and Pr <b>3.12</b> (closed loop vector and servo
	modes only) Has offset measurement test been completed? (servo mode only) Reduce the values in current loop gain parameters - Pr <b>4.13</b> and Pr <b>4.14</b> (closed loop vector and servo modes only)

### Table 13-1 Trip indications

Trip	Diagnosis
br.th	Internal braking resistor thermistor temperature monitoring fail (size 0 only)
	If no internal brake resistor is installed, set Pr 0.51 (or Pr 10.37) to 8 to disable this trip.
10	If an internal brake resistor is installed:  • Ensure that the internal braking resistor thermistor is connected correctly
	Ensure that the fan in the drive is working correctly
	Replace the internal braking resistor
C.Acc	SMARTCARD trip: SMARTCARD Read / Write fail
185	Check SMARTCARD is installed / located correctly Ensure SMARTCARD is not writing data to data location 500 to 999
103	Replace SMARTCARD
C.boot	SMARTCARD trip: The menu 0 parameter modification cannot be saved to the SMARTCARD because the necessary file han to been created on the SMARTCARD
	A write to a menu 0 parameter has been initiated via the keypad with Pr 11.42 set to auto(3) or boot(4), but the necessary file on the
177	SMARTCARD has not bee created
	Ensure that Pr 11.42 is correctly set and reset the drive to create the necessary file on the SMARTCARD  Re-attempt the parameter write to the menu 0 parameter
C.bUSY	SMARTCARD trip: SMARTCARD can not perform the required function as it is being accessed by a Solutions Module
178	Wait for the Solutions Module to finish accessing the SMARTCARD and then re-attempt the required function
C.Chg	SMARTCARD trip: Data location already contains data
	Erase data in data location
179	Write data to an alternative data location
C.cPr	SMARTCARD trip: The values stored in the drive and the values in the data block on the SMARTCARD are different
188	Press the red  reset button
C.dAt	SMARTCARD trip: Data location specified does not contain any data
183	Ensure data block number is correct
C.Err	SMARTCARD trip: SMARTCARD data is corrupted
	Ensure the card is located correctly
182	Erase data and retry Replace SMARTCARD
C.Full	SMARTCARD trip: SMARTCARD full
184	Delete a data block or use different SMARTCARD
cL2	Analog input 2 current loss (current mode)
28	Check analog input 2 (terminal 7) current signal is present (4-20mA, 20-4mA)
cL3	Analog input 3 current loss (current mode)
29	Check analog input 3 (terminal 8) current signal is present (4-20mA, 20-4mA)
CL.bit	Trip initiated from the control word (Pr 6.42)
35	Disable the control word by setting Pr 6.43 to 0 or check setting of Pr 6.42
ConF.P	The number of power modules installed no longer matches the value stored in Pr 11.35
	Ensure that all power modules are correctly connected
111	Ensure that all power modules have powered up correctly
	Ensure that the value in Pr 11.35 matches the number of power modules connected
C.OPtn	SMARTCARD trip: Solutions Modules installed are different between source drive and destination drive
100	Ensure correct Solutions Modules are installed Ensure Solutions Modules are in the same Solutions Module slot
180	Press the red reset button
C.Prod	SMARTCARD trip: The data blocks on the SMARTCARD are not compatible with this product
175	Erase all data on the SMARTCARD by setting Pr xx.00 to 9999 and pressing the red long reset button Replace SMARTCARD
C.rdo	SMARTCARD trip: SMARTCARD has the Read Only bit set
181	Enter 9777 in Pr xx.00 to allow SMARTCARD Read / Write access Ensure the drive is not writing to data locations 500 to 999 on the card

Trip	Diagnosis
EnC7	Drive encoder trip: Initialisation failed
195	Re-set the drive Check the correct encoder type is entered into Pr 3.38 Check encoder wiring Check encoder power supply is set correctly Carry out the auto-configuration Pr 3.41
EnC8	Replace feedback device  Drive encoder trip: Auto configuration on power up has been requested and failed
196	Change the setting of Pr <b>3.41</b> to 0 and manually enter the drive encoder turns (Pr <b>3.33</b> ) and the equivalent number of lines per revolution (Pr <b>3.34</b> ) Check the comms resolution
EnC9	Drive encoder trip: Position feedback selected is selected from a Solutions Module slot which does not have a speed / position feedback Solutions Module installed
197	Check setting of Pr 3.26 (or Pr 21.21 if the second motor parameters have been enabled)
EnC10	Drive encoder trip: Servo mode phasing failure because encoder phase angle (Pr 3.25 or Pr 21.20) is incorrect
198	Check the encoder wiring.  Perform an autotune to measure the encoder phase angle or manually enter the correct phase angle into Pr 3.25 (or Pr 21.20).  Spurious Enc10 trips can be seen in very dynamic applications. This trip can be disabled by setting the overspeed threshold in Pr 3.08 to a value greater than zero. Caution should be used in setting the over speed threshold level as a value which is too large may mean that an encoder fault will not be detected.
Enc11	Drive encoder trip: A failure has occurred during the alignment of the analog signals of a SINCOS encoder with the digital count derived from the sine and cosine waveforms and the comms position (if applicable). This fault is usually due to nois on the sine and cosine signals.
161	Check encoder cable shield.  Examine sine and cosine signals for noise.
Enc12	Drive encoder trip: Hiperface encoder - The encoder type could not be identified during auto-configuration
162	Check encoder type can be auto-configured. Check encoder wiring. Enter parameters manually.
Enc13	Drive encoder trip: EnDat encoder - The number of encoder turns read from the encoder during auto-configuration is not power of 2
163	Select a different type of encoder.
Enc14	Drive encoder trip: EnDat encoder - The number of comms bits defining the encoder position within a turn read from the encoder during auto-configuration is too large.
164	Select a different type of encoder. Faulty encoder.
Enc15	Drive encoder trip: The number of periods per revolution calculated from encoder data during auto-configuration is either less than 2 or greater than 50,000.
165	Linear motor pole pitch / encoder ppr set up is incorrect or out of parameter range i.e. Pr <b>5.36</b> = 0 or Pr <b>21.31</b> = 0. Faulty encoder.
Enc16	Drive encoder trip: EnDat encoder - The number of comms bits per period for a linear encoder exceeds 255.
166	Select a different type of encoder. Faulty encoder.
Enc17	Drive encoder trip: The periods per revolution obtained during auto-configuration for a rotary SINCOS encoder is not a power of two.
167	Select a different type of encoder. Faulty encoder.
ENP.Er	Data error from electronic nameplate stored in selected position feedback device
176	Replace feedback device
Et	External trip
6	Check terminal 31 signal Check value of Pr 10.32 Enter 12001 in Pr xx.00 and check for parameter controlling Pr 10.32 Ensure Pr 10.32 or Pr 10.38 (=6) are not being controlled by serial comms
11504	Data processing error: CPU address error
HF01	But processing error. Or a dudress error

Trip	Diagnosis
O.ht3	Drive over-temperature based on thermal model
27	The drive will attempt to stop the motor before tripping. If the motor does not stop in 10s the drive trips immediately.  Check enclosure / drive fans are still functioning correctly  Check enclosure ventilation paths  Check enclosure door filters Increase ventilation  Decrease acceleration / deceleration rates  Reduce duty cycle  Reduce motor load
Oht4.P	Power module rectifier over temperature or input snubber resistor over temperature (size 4 and above)
102	Check for supply imbalance Check for supply disturbance such as notching from a DC drive Check enclosure / drive fans are still functioning correctly Check enclosure ventilation paths Check enclosure door filters Increase ventilation Decrease acceleration / deceleration rates Reduce drive switching frequency Reduce duty cycle Reduce motor load
OI.AC	
OI.AC	Instantaneous output over current detected: peak output current greater than 222%  Acceleration /deceleration rate is too short.  If seen during autotune reduce voltage boost Pr 5.15  Check for short circuit on output cabling  Check integrity of motor insulation
3	Check feedback device wiring Check feedback device mechanical coupling Check feedback signals are free from noise Is motor cable length within limits for that frame size? Reduce the values in speed loop gain parameters – Pr 3.10, Pr 3.11 and Pr 3.12 (closed loop vector and servo modes only) Has offset measurement test been completed? (servo mode only) Reduce the values in current loop gain parameters - Pr 4.13 and Pr 4.14 (closed loop vector and servo modes only)
OIAC.P	Power module over current detected from the module output currents
104	Acceleration /deceleration rate is too short.  If seen during autotune reduce voltage boost Pr 5.15  Check for short circuit on output cabling Check integrity of motor insulation Check feedback device wiring Check feedback device mechanical coupling Check feedback signals are free from noise Is motor cable length within limits for that frame size? Reduce the values in speed loop gain parameters – Pr 3.10, Pr 3.11 and Pr 3.12 (closed loop vector and servo modes only) Has offset measurement test been completed? (servo mode only) Reduce the values in current loop gain parameters - Pr 4.13 and Pr 4.14 (closed loop vector and servo modes only)
Ol.br	Braking transistor over-current detected: short circuit protection for the braking transistor activated
4	Check braking resistor wiring Check braking resistor value is greater than or equal to the minimum resistance value Check braking resistor insulation
Olbr.P	Power module braking IGBT over current
103	Check braking resistor wiring Check braking resistor value is greater than or equal to the minimum resistance value Check braking resistor insulation
OldC.P	Power module over current detected from IGBT on state voltage monitoring
109	Vce IGBT protection activated. Check motor and cable insulation.
O.Ld1	Digital output overload: total current drawn from 24V supply and digital outputs exceeds 200mA
26	Check total load on digital outputs (terminals 24,25,26)and +24V rail (terminal 22)
O.SPd	Motor speed has exceeded the over speed threshold
7	Increase the over speed trip threshold in Pr 3.08 (closed loop vector and servo modes only)  Speed has exceeded 1.2 x Pr 1.06 or Pr 1.07 (open loop mode)  Reduce the speed loop P gain (Pr 3.10) to reduce the speed overshoot (closed loop vector and servo modes only)

Safety Product Information Installation Inst
--

Trip	Diagnosis								
OV	DC bus voltage has exceeded the peak level or the maximum continuous level for 15 seconds								
2	Increase deceleration ramp (Pr 0.04) Decrease braking resistor value (staying above the minimum value) Check nominal AC supply level Check for supply disturbances which could cause the DC bus to rise – voltage overshoot after supply recovery from a notch induced by DC drives Check motor insulation								
2	Drive voltage rating         Peak voltage         Maximum continuous voltage level (15s)           200         415         410           400         830         815           575         990         970           690         1190         1175           If the drive is operating in low voltage DC mode the overvoltage trip level is 1.45 x Pr 6.46.								
OV.P	Power module DC bus voltage has exceeded the peak level or the maximum continuous level for 15 seconds								
106	Increase deceleration ramp (Pr 0.04) Decrease braking resistor value (staying above the minimum value) Check nominal AC supply level Check for supply disturbances which could cause the DC bus to rise – voltage overshoot after supply recovery from a notch induced by DC drives Check motor insulation Drive voltage rating Peak voltage Maximum continuous voltage level (15s)  200 415 410 400 830 815 575 990 970 690 1190 1175  If the drive is operating in low voltage DC mode the overvoltage trip level is 1.45 x Pr 6.46.								
PAd	Keypad has been removed when the drive is receiving the speed reference from the keypad								
34	Install keypad and reset Change speed reference selector to select speed reference from another source								
PH	AC voltage input phase loss or large supply imbalance detected								
32	Ensure all three phases are present and balanced Check input voltage levels are correct (at full load)  NOTE  Load level must be between 50 and 100% for the drive to trip under phase loss conditions. The drive will attempt to stop the motor before this trip is initiated.								
PH.P	Power module phase loss detection								
107	Ensure all three phases are present and balanced Check input voltage levels are correct (at full load)								
PS	Internal power supply fault								
5	Remove any Solutions Modules and reset Hardware fault - return drive to supplier								
PS.10V	10V user power supply current greater than 10mA								
8	Check wiring to terminal 4 Reduce load on terminal 4								
PS.24V	24V internal power supply overload								
9	The total user load of the drive and Solutions Modules has exceeded the internal 24V power supply limit. The user load consists of the drive's digital outputs, the SM-I/O Plus digital outputs, the drive's main encoder supply and the SM-Universal Encoder Plus encoder supply.  Reduce load and reset Provide an external 24V >50W power supply Remove any Solutions Modules and reset								
PS.P	Power module power supply fail								
108	Remove any Solutions Modules and reset Hardware fault - return drive to supplier								
PSAVE.Er	Power down save parameters in the EEPROM are corrupt								
37	Indicates that the power was removed when power down save parameters were being saved.  The drive will revert back to the power down parameter set that was last saved successfully.  Perform a user save (Pr xx.00 to 1000 or 1001 and reset the drive) or power down the drive normally to ensure this trip does or occur the next time the drive is powered up.								

Safety information	Product Mechanical Electrical Getting Basic Running of the motor Optimization operation operatio								
Trip	Diagnosis								
rS	Failure to measure resistance during autotune or when starting in open loop vector mode 0 or 3								
33	Check motor power connection continuity								
SAVE.Er	User save parameters in the EEPROM are corrupt								
36	Indicates that the power was removed when user parameters were being saved.  The drive will revert back to the user parameter set that was last saved successfully.  Perform a user save (Pr xx.00 to 1000 or 1001 and reset the drive) to ensure this trip does or occur the next time the drive is powered up.								
SCL	Drive RS485 serial comms loss to remote keypad								
30	Reinstall the cable between the drive and keypad Check cable for damage Replace cable Replace keypad								
SLX.dF	Solutions Module slot X trip: Solutions Module type installed in slot X changed								
204,209,21	Save parameters and reset								

Safety information installation 
#### Trip Diagnosis SLX.Er Solutions Module slot X trip: Solutions Module in slot X has detected a fault Feedback module category Check value in Pr 15/16/17.50. The following table lists the possible error codes for the SM-Universal Encoder Plus, SM-Encoder Output Plus, SM-Encoder Plus and SM-Resolver. See the Diagnostics section in the relevant Solutions Module User Guide for more information Error code Module Diagnostic **Trip Description** All No fault detected No trip SM-I Iniversal Check encoder power supply wiring and encoder current Encoder Plus & requirement Maximum current = 200mA @ 15V, or 300mA Encoder power supply overload 1 SM-Encoder @ 8V and 5V **Output Plus** SM-Resolver Excitation output short circuit Check the excitation output wiring. Check cable continuity SM-Universal Check wiring of feedback signals is correct 2 **Encoder Plus &** Wire break Check supply voltage or excitation output level SM-Resolver Replace feedback device Check the encoder signal for noise SM-Universal Check encoder shielding Phase offset incorrect while 3 **Encoder Plus** running Check the integrity of the encoder mechanical mounting Repeat the offset measurement test Ensure encoder power supply is correct SM-Universal Feedback device communications Ensure baud rate is correct 4 **Encoder Plus** Check encoder wiring Replace feedback device SM-Universal Check the encoder signal for noise 5 Checksum or CRC error **Encoder Plus** Check the encoder cable shielding SM-Universal 6 Encoder has indicated an error Replace encoder **Encoder Plus** Check the correct encoder type is entered into Pr 15/16/17.15 SM-Universal Check encoder wiring 7 Initialisation failed **Encoder Plus** Check supply voltage level Replace feedback device Change the setting of Pr 15/16/17.18 and manually enter 202,207,212 the number of turns bits (Pr 15/16/17.09) and the equivalent SM-Universal Auto configuration on power up 8 **Encoder Plus** has been requested and failed number of lines per revolution (Pr 15/16/17.10) and the single turn comms bits (Pr 15/16/17.11) SM-Universal Check motor temperature 9 Motor thermistor trip **Encoder Plus** Check thermistor continuity SM-Universal Check motor thermistor wiring 10 Motor thermistor short circuit **Encoder Plus** Replace motor / motor thermistor Failure of the sincos analog SM-Universal Check encoder cable shield. position alignment during encoder **Encoder Plus** Examine sine and cosine signals for noise. initialisation 11 Check that the correct number of resolver poles has been SM-Resolver Poles not compatible with motor set in Pr 15/16/17.15. Check encoder type can be auto-configured. SM-Universal Encoder type could not be 12 Check encoder wiring. **Encoder Plus** identified during auto-configuration Enter parameters manually. Number of encoder turns read from SM-Universal 13 the encoder during auto-Select a different type of encoder. **Encoder Plus** configuration is not a power of 2 Number of comms bits defining the SM-Universal encoder position within a turn read Select a different type of encoder. 14 **Encoder Plus** from the encoder during auto-Faulty encoder. configuration is too large The number of periods per Linear motor pole pitch / encoder ppr set up is incorrect or SM-Universal revolution calculated from encoder 15 out of parameter range i.e. Pr 5.36 = 0 or Pr 21.31 = 0. **Encoder Plus** data during auto-configuration is Faulty encoder. either <2 or >50,000. The number of comms bits per Select a different type of encoder. SM-Universal 16 period for a linear encoder **Encoder Plus** Faulty encoder. exceeds 255. Check ambient temperature 74 ΑII Solutions Module has overheated Check enclosure ventilation

The trips can be grouped into the following categories. It should be noted that a trip can only occur when the drive is not tripped or is already tripped but with a trip with a lower priority number.

Table 13-3 Trip categories

Priority	Category	Trips	Comments
1	Hardware faults	HF01 to HF16	These indicate serious internal problems and cannot be reset. The drive is inactive after one of these trips and the display shows <b>HFxx</b> . The Drive OK relay opens and the serial comms will not function.
2	Non-resetable trips	HF17 to HF32, SL1.HF, SL2.HF, SL3.HF	Cannot be reset. Requires the drive to be powered down.
3	EEF trip	EEF	Cannot be reset unless a code to load defaults is first entered in Pr xx.00 or Pr 11.43.
4	SMARTCARD trips	C.boot, C.Busy, C.Chg, C.OPtn, C.RdO, C.Err, C.dat, C.FULL, C.Acc, C.rtg, C.TyP, C.cpr, C.Prod	Can be reset after 1.0s SMARTCARD trips have priority 5 during power-up
4	Encoder power supply trips	PS.24V, EnC1	Can be reset after 1.0s These trips can only override the following priority 5 trips: EnC2 to EnC8 or Enc11 to Enc17
5	Autotune	tunE, tunE1 to tunE7	Can be reset after 1.0s, but the drive cannot be made to run unless it is disabled via the SAFE TORQUE OFF input (terminal 31), <i>Drive enable</i> (Pr <b>6.15</b> ) or the <i>Control word</i> (Pr <b>6.42</b> and Pr <b>6.43</b> ).
5	Normal trips with extended reset	OI.AC, OI.Br, OIAC.P, OIBr.P, OldC.P	Can be reset after 10.0s
5	Normal trips	All other trips not included in this table	Can be reset after 1.0s
5	Non-important trips	th, thS, Old1, cL2, cL3, SCL	If Pr 10.37 is 1 or 3 (i.e. bit 0 set to 1), the drive will stop before tripping
5	Phase loss	PH	The drive attempts to stop before tripping
5	Drive over-heat based on thermal model	O.ht3	The drive attempts to stop before tripping, but if it does not stop within 10s the drive will automatically trip
6	Self-resetting trips	UV	Under voltage trip cannot be reset by the user, but is automatically reset by the drive when the supply voltage is with specification

Although the UV trip operates in a similar way to all other trips, all drive functions can still operate but the drive cannot be enabled. The following differences apply to the UV trip:

- Power-down save user parameters are saved when UV trip is activated except when the main high voltage supply is not active (i.e. operating in Low Voltage DC Supply Mode, Pr 6.44 = 1).
- The UV trip is self-resetting when the DC bus voltage rises above the drive restart voltage level. If another trip is active instead of UV at this point, the trip is not reset.
- 3. The drive can change between using the main high voltage supply and low voltage DC supply only when the drive is in the under voltage condition (Pr 10.16 = 1). The UV trip can only be seen as active if another trip is not active in the under voltage condition.
- 4. When the drive is first powered up a UV trip is initiated if the supply voltage is below the restart voltage level and another trip is not active. This does not cause save power down save parameters to be saved at this point.

#### 13.2 **Alarm indications**

In any mode an alarm flashes alternately with the data displayed on the 2nd row when one of the following conditions occur. If action is not taken to eliminate any alarm except "Autotune", "Lt" and "PLC" the drive may eventually trip. Alarms flash once every 640ms except "PLC" which flashes once every 10s. Alarms are not displayed when a parameter is being edited.

Table 13-4 Alarm indications

will flash 'PLC' once every 10s.

	ann maications

### 13.4 Displaying the trip history

The drive retains a log of the last 10 trips that have occurred in Pr 10.20 to Pr 10.29 and the corresponding multi-module drive module number (Pr 6.49 = 0) or the trip time (Pr 6.49 = 1) for each trip in Pr 10.41 to Pr 10.51. The time of the trip is recorded from the powered-up clock (if Pr 6.28 = 0) or from the run time clock (if Pr 6.28 = 1).

Pr 10.20 is the most recent trip, or the current trip if the drive is in a trip condition (with the module number or trip time stored in Pr 10.41 and Pr 10.42). Pr 10.29 is the oldest trip (with the module number or trip time stored in Pr 10.51). Each time a new trip occurs, all the parameters move down one, such that the current trip (and time) is stored in Pr 10.20 (and Pr 10.41 to Pr 10.42) and the oldest trip (and time) is lost out of the bottom of the log.

If any parameter between Pr **10.20** and Pr **10.29** inclusive is read by serial communications, then the trip number in Table 13-1 *Trip indications* on page 255 is the value transmitted.

### 13.5 Behaviour of the drive when tripped

If the drive trips, the output of the drive is disabled so that the drive stops controlling the motor. If any trip occurs (except the UV trip) the following read only parameters are frozen until the trip is cleared. This is to help in diagnosing the cause of the trip.

Parameter	Description
1.01	Frequency/speed reference
1.02	Pre-skip filter reference
1.03	Pre-ramp reference
2.01	Post-ramp reference
3.01	Frequency slaving demand/Final speed ref
3.02	Speed feedback
3.03	Speed error
3.04	Speed controller output
4.01	Current magnitude
4.02	Active current
4.17	Reactive current
5.01	Output frequency
5.02	Output voltage
5.03	Power
5.05	DC bus voltage
7.01	Analog input 1
7.02	Analog input 2
7.03	Analog input 3

#### Analog and digital I/O

The analog and digital I/O on the drive continue to work correctly if a trip occurs, except the digital outputs will go low if one of the following trips occur: O.Ld1, PS.24V.

### **Drive logic functions**

The drive logic functions (i.e. PID, variable selectors, threshold detectors, etc), continue to operate when the drive is tripped.

### Onboard PLC program

The Onboard PLC program continues to run if the drive is tripped, except if one of Onboard PLC program trips occur.

#### **Braking IGBT**

The braking IGBT continues to operate even when the output of the drive is not enabled (except if the low voltage DC supply is being used), but is only disabled if any of the following trips occurs or would occur if another trip had not already become active: OI.Br, PS, It.Br, OV or any HFxx trip.

# 14 UL Listing information

Size 6 to 9 Free Standing drives have been assessed to meet both UL and cUL requirements.

The Control Techniques UL file number is E171230. Confirmation of UL listing can be found on the UL website: www.ul.com.

#### 14.1 Common UL information

#### Conformity

The drive conforms to UL listing requirements only when the following are observed:

- The drive is installed in a type 1 enclosure, or better, as defined by UI 50
- The surrounding air temperature does not exceed 40°C (104°F) when the drive is operating
- The terminal tightening torques specified in section 3.8.2 Terminal sizes and torque settings on page 49
- If the drive control stage is supplied by an external power supply (+24V), the external power supply must be a UL Class 2 power supply

#### Motor overload protection

The drive provides motor overload protection. The default overload protection level is no higher than 150% of full-load current (FLC) of the drive in open loop mode and no higher than 175% of full-load current (FLC) of the drive in closed loop vector or servo modes. It is necessary for the motor rated current to be entered into Pr **0.46** (or Pr **5.07**) for the protection to operate correctly. The protection level may be adjusted below 150% if required. Refer to section 8.3 *Current limits* on page 125 for more information. The drive also provides motor thermal protection. Refer to section 8.4 *Motor thermal protection* on page 125.

#### **Overspeed Protection**

The drive provides overspeed protection. However, it does not provide the level of protection afforded by an independent high integrity overspeed protection device.

## 14.2 Power dependant UL information

#### Conformity

The drive conforms to UL listing requirements only when the following is observed:

#### **Fuses**

UL recognized semiconductor fuses type Ferraz PSC size 32 660V (e.g. Ferraz designation 6,6 URD 32 0400 for a 400A 660Vac fuse) or Siba UL recognized semiconductor fuses type URS SQB2 690Vac (e.g. Siba model number 20 627 31.400). The model does not comply with UL if any other fuses or MCBs are used in place of those stated.

For further details refer to Table 4-3 400V Free Standing drive input current, fuse and cable size rating on page 61.

With reference to the above the fuse current rating should be taken from the column headed 'Semiconductor IEC class aR'. This semiconductor fuse must be used in series with a HRC type fuse to provide full circuit protection. For UL applications the applicable HRC type fuse to use is a UL listed class J, with the current rating obtained from the column headed 'HRC IEC class gG UL class J'. Alternatively any circuit breaker of the correct rating which meets the requirements of the NEC (national Electric Code) for branch circuit protection can be used in place of the class J fuse.

#### Field wiring

Class 1 75°C (167°F) copper wire only is used in the installation.

#### Field wiring connectors

 UL listed wire connectors are used for terminating power circuit field wiring e.g. Ilsco TA series.

## 14.3 AC supply specification

The drive is suitable for use in a circuit capable of delivering not more than 100,000rms symmetrical Amperes at 528Vac rms maximum (400V drives) or 600Vac rms maximum (690V drives).

### 14.4 Maximum continuous output current

The drive models are listed as having the maximum continuous output currents (FLC) shown in Table 14-1 (See Chapter 12 *Technical data* on page 243 for details).

Table 14-1 Maximum continuous output current

Model	FLC (A)	Model	FLC (A)
SP64X1	205	SP66X1	125
SP64X2	236	SP66X2	144
SP74X1	290	SP76X1	168

SP84X4	620	SP96X1	400
SP94X1	690	SP96X3	533
SP94X3	900	SP96X4	616
SP94X4	1010	SP96X5	711
SP94X5	1164		

<sup>\*</sup>SP74X2 output current rating conforms to UL and cUL listing requirements only when the ambient temperature is 40°C or lower.

## 14.5 Safety label

The safety label supplied with the connectors and mounting brackets must be placed on a fixed part inside the drive enclosure where it can be seen clearly by maintenance personnel for UL compliance.

The label clearly states "CAUTION Risk of Electric Shock Power down unit 10 minutes before removing cover".
