**2.12.2** Cable Diagrams

The cable diagrams illustrated below and the cable diagrams recommended by Koyo Electronic Industries may differ, however, using these cables for your PLC operations will not cause any problems.

*Ground your PLC's FG terminal according to your country's applicable standard. For details, refer to the corresponding PLC manual.*

- **Connect the FG line of the Shield cable to either the GP or PLC, depending on your environment. When using a connector hood and grounding the FG line, be sure to use an electrical conductor.**
- **For the RS-232C connection, use a cable length less than 15m.**
- **If a communications cable is used, it must be connected to the SG (signal ground).**
- **For the RS-422 connection, use a cable length less than 600m.**

L/H

• Bit write operation of bit devices

*When the GP writes to the PLC's bit addresses, it reads the data including the bit address to be written by a unit, word (as word data) first. After that, the GP changes only that bit to be written of the read out data and writes it to the PLC as word data. Therefore writing to the bit addresses before/after the bit address to be written from the ladder program in the middle of the bit write operation might cause the incorrect data to be written.*
